Hydraulic Valves Industrial Standard

Including Denison Hydraulics

- aerospace
- climate control
- electromechanical
- filtration
- fluid & gas handling
- hydraulics
- pneumatics
- process control
- sealing & shielding

ENGINEERING YOUR SUCCESS.

Introducing Product Index, 4 Brands under 1 Roof, System Solutions	1
Directional Control Valves Seated valves, spool valves, direct and pilot operated	2
Proportional DC Valves Standard dynamics; high dynamics; VCD® dynamics	3
Pressure Valves Subplate and screw-in mounting	4
Flow Valves Throttle and flow control valves, subplate and screw-in mounting	5
Check Valves Direct and pilot operated, subplate and screw-in mounting	6
Sandwich Valves For pressure, check and flow functions	7
Slip-In Cartridge Valves According to ISO 7368, with pressure, directional, flow and check functions	8
SAE Flange Valves For pressure, directional, flow and check functions	9
Valves for Pipe Mounting With pressure, directional, flow and check functions	10
Electronics Amplifiers, axis controllers and accessories	11
Accessories Subplates, pressure gauge valves, pressure switches, pressure intensifiers	12
Appendix Starting up hydraulic systems, hydraulic fluids	13

Parker develops superior products. Over the years we have added many market leading lines in order to provide you with the best offering in the world:

Towler was founded in 1866 as a pioneer in press hydraulics at very high pressures. The design of a range of slip-in cartridges for manifolds brought unlimited flexibility into hydraulic circuits and enhanced hydraulics in many applications. A wide range of proportional valves was developed from pressure controls over directional controls to fast acting cartridge valves.

Parker was founded in 1918 and started with hydraulics for aircrafts. The Colorflow flow and pressure valves, manually adjustable with visual setting control, were a revolutionary offering for the industrial market, followed by various lines of solenoid operated directional control valves. New on the market: wet solenoids for leak-free hydraulics.

Denison was founded in 1931 and another pioneer in press hydraulics. They were the first to introduce a seat-type pilot operated cartridge relief valve to the market and set the trend for all manufacturers. The valve is still unbeaten in its ease of use and performance in all applications. Various housing options are successfully used in all market segments.

Hydraulik Ring was formed in 1967 as a dedicated manufacturer of high precision hydraulics for an association of German machine tool makers. Their product strength was precise flow control in open or closed loop applications, high performance pressure control and pressure intensification for clamping.

This catalogue contains the best industrial valves of these brands. It is an outperforming and full range of industrial valves for any kind of application. In order to allow our new customers from the latest line addition to carry on with model codes in existing parts lists we show some of the valves under the Denison brand and model code in parallel to the Parker brand and model code.

Dr. Gerd Scheffel
General Manager

Parker is more than a supplier of excellent components. Together with our customers, we develop innovative systems solutions. In this industrial valves catalogue, we would like to point out to you our special competence in industrial control units. Our experienced, highly motivated team answers technical needs with complete, sound solutions.

Our performance spectrum comprises a complex understanding of the job, project management, design, and production, including final tests of control units on our modern, automated test beds. In addition we offer compact hydraulic axis controls.

When you entrust us with your system requirements, you can rely on getting an optimal solution from the Parker valves program with all components used in accordance with their characteristics. Furthermore you can rely on us taking full responsibility for all our valves, electronics and combined functions within the system.

Parker is strong in customized solutions but we also supply standardized press controls (e.g. certified versions in

1

nominal sizes NG 06 through NG50) as fully shown in our brochure HY11-3235/UK on Hydraulics for Press Controls.

Contact your Parker representation for information and offerings concerning your hydraulics.

Characteristics

The directional valve type D1SE is equipped with a wet pin armature solenoid, drain free tapered poppet valve and compatible with the standards DIN NG06, CETOP 03, and NFPA D03. Due to the 3/2 way design, port A is either connected with P or discharged in the tank. The neutral position (solenoid not activated) is taken automatically by a return spring. This position remains until the solenoid is energized.

The valve poppet including activation lever and armature of the solenoid are located in the pressurized oil chamber of connection T. The valve poppet is designed such that there can be no differential area in its axial operational direction (opening, closing). Thus it is statically pressure-balanced so that the valve can be switched in both flow directions even under pressure.

The unit has an all-steel design, the important functional inner parts are hardened, the poppet and seat are grinded.

Dimensions

Surface finish	Kit	Kit	Kit	Kit
$\sqrt{R_{max} 6.3}$ $\square 0.01/100$	BK375	4x M5x30 DIN 912 12.9	7.6 Nm $\pm 15\%$	NBR: SK-D1SE-70 FPM: DK-D1SE-V70

Subplates and manifolds see chapter 12.

The space necessary to remove the plug per EN 175301-803, design type AF is at least 15 mm.
The torque for the screw M3 of the plug has to be 0.5 to 0.6 Nm.

Characteristics

The new NG06 directional control valve is available with both Parker (D1VW) and Denison (4D01) model codes.

The new design provides high functional limits up to 80 l/min in combination with a very low, energy-saving pressure drop.

A wide variety of spool options allows to design an unlimited number of hydraulic circuits.

Versions with 8 watt coils, position control, Atex approval, surface protection and connector variants are shown in the following chapters.

Shift Limits

The diagram below specifies the shift limits for valves with DC solenoids. Valves with spool position “F” or “M” can only be operated up to 70% of the limits. The specifications apply to a viscosity of 40mm²/s and balanced flow

conditions. The shift limits can be considerably lower at unbalanced flow conditions. To avoid flow rates beyond the shift limits, a plug-in orifice can be inserted in the P-port.

Response times D1VW Standard and Soft Shift

X-Number	Orifice size	3 positions: spool center condition				2 positions	
		Closed		Open		Energize	De-energize
		Energize	De-energize	Energize	De-energize		
(Standard)	-	32 ms (DC) 13 ms (AC)*	40 ms (DC) 20 ms (AC)*	32 ms (DC) 13 ms (AC)*	40 ms (DC) 20 ms (AC)*	32 ms (DC) 13 ms (AC)*	40 ms (DC) 20 ms (AC)*
S2	0.50	200 ms (DC)	650 ms (DC)	700 ms (DC)	650 ms (DC)	175 ms (DC)	225 ms (DC)
S3 (G3)	0.75	125 ms (DC)	325 ms (DC)	550 ms (DC)	550 ms (DC)	100 ms (DC)	100 ms (DC)

* For AC input and soft shift use rectifier plug.

Step response times were obtained under the following conditions: $v = 40 \text{ mm}^2/\text{s}$ at 50°C with the valve operating at nominal pressure and flow. Published response times are nominal and may vary with spool, flow, pressure and temperature.

Acceleration for orifice size 0.75, code "S3" (archived against a valve without soft shift)

For even softer shifting, the proportional spools 081, 082, 101 and 102 can be used.

	BK375	4x M5x30 DIN 912 12.9	7.6 Nm ±15%	NBR: SK-D1VW-N-91 FPM: SK-D1VW-V-91

The space necessary to remove the plug per EN 175301-803, design type AF is at least 15 mm.
The torque for the screw M3 of the plug has to be 0.5 to 0.6 Nm.

D1VW-4D01_UK.INDD CM_10.03.2008.1

The D1VW 8 Watt series is based on the standard D1VW design. The low watt, low current (<0.5 A) solenoid allows direct connection to a PLC or a bus knot. The valves are offered with standard solenoid connection (as per EN175301-803) and M12 x 1 connection. The version with M12 x 1 connection and LEDs are conform to the DESINA standard (**D**istribut**E**d and **S**tandardised **I**Nst**A**llation technology) for machine tools and manufacturing systems.

The space necessary to remove the plug per EN 175301-803, design type AF is at least 15 mm.
The torque for the screw M3 of the plug has to be 0.5 to 0.6 Nm.

Characteristics

The direct operated 4/2 directional valves with inductive position control are typically used in safety relevant applications. The start or end position can be monitored. The position control is only available for single solenoid valves.

The fail-safe position of the directional valve during power failure is the spring offset position.

2

Attention

The adjustment of the position control is factory set and sealed. Replacement and repairs can only be undertaken by the manufacturer.

Definitions

Start position monitored:

The valve is de-energized. The inductive switch gives a signal at the moment when the spool leaves the spring offset position (below 15% spool stroke).

End position monitored:

The inductive switch gives a signal before the end position is reached (above 85% spool stroke).

The switch can only be located on the opposite side of the solenoid for direct operated valves.

The flow curve diagram shows the flow versus pressure drop curves for all spool types. The relevant curve number

for each spool type, operating position and flow direction is given in the table below.

The torque for the screw M3 of the plug has to be 0.5 to 0.6 Nm.

Attention

The adjustment of the position control is factory set and sealed. Replacement and repairs can only be undertaken by the manufacturer.

Characteristics

**Directional Control Valve
Series D1VW Explosion Proof**

The D1VW with explosion proof solenoids is based on the standard D1VW series. The specific solenoid design allows the use in hazardous environments.

The explosion proof class is

CE  II 2 G
EEx me II T4

for use in zone 1.

All explosion proof solenoids are DC design. For AC (code P and N) the input voltage is internally rectified.

2

2

Flow curve diagram

The diagram below specifies the shift limits for valves with DC solenoids. Valves with spool position “F” or “M” can only be operated up to 70% of the limits. The specifications apply to a viscosity 40mm²/s and balanced flow

conditions. The shift limits can be considerably lower at unbalanced flow conditions. To avoid flow rates beyond the shift limits, a plug-in orifice can be inserted in the P-port.

D1VW expl_UK.INDD CM_21.01.2008.1

The new D1MW is based on the D1VW series of directional control valves size NG06, but offers additional corrosion protection of the valve body, the solenoid coil and the anchor tube as well as the typical solenoid connections for the mobile market such as AMP Junior Timer and DP4 "Deutsch".

Technical features

- High corrosion protection (optional)
- Solenoid connection:
 - Standard (as per EN175301-803)
 - AMP Junior Timer
 - DP4 2-pin "Deutsch"
- Robust design for rough applications
- Extended manual override with rubber cover (optional)

With AMP Junior Timer

	BK375	4x M5x30 DIN 912 12.9	7.6 Nm ±15%	NBR: SK-D1VW-N-91 FPM: SK-D1VW-V-91

The space necessary to remove the plug per EN 175301-803, design type AF is at least 15 mm.
The torque for the screw M3 of the plug has to be 0.5 to 0.6 Nm.

The direct operated directional control valve size NG10 is available with both Parker (series D3W) and Denison (series 4D02) model codes.

Both series are available with a soft shift option for smooth operation. An additional orifice in the solenoid anchor dampens the shifting time for D3W. For the 4D02 the orifice is located in the valve body.

S4	1.0 mm	320 ms	550 ms
S7	1.75 mm	160 ms	370 ms

Step response times were obtained under the following conditions: $\nu = 35 \text{ mm}^2/\text{s}$ at 50°C with the valve operating at 175 bar and 65 l/min. Published response times are nominal and may vary with spool, flow, pressure and temperature.

* For AC input and soft shift use rectifier plug.

Acceleration for different orifice sizes (archived against a valve without soft shift)

* Note: For 4D02 the orifice is located in the Z-channel of the valve body.

For even softer shifting, the proportional spools 81, 82, 101 and 102 can be used.

	BK385	4x M6x40 DIN 912 12.9	13.2 Nm ±15%	NBR: SK-D3W-30 FPM: SK-D3W-V30

The space necessary to remove the plug per EN 175301-803, design type AF is at least 15 mm.
The torque for the screw M3 of the plug has to be 0.5 to 0.6 Nm.

D3W stand_UK.INDD CM_21.01.2008.1

The 4/2 directional valves operated directly by solenoids with inductive position control are used as monitoring valves. The start or end position can be monitored. The position control is only available for single solenoid valves.

The fail-safe position of the directional valve during power failure is the spring offset position.

2

Attention

The adjustment of the position control is factory set and sealed. Replacement and repairs can only be undertaken by the manufacturer.

Definitions

Start position monitored:

The valve is de-energized. The inductive switch gives a signal at the moment when the spool leaves the spring offset position (below 15% spool stroke).

End position monitored:

The inductive switch gives a signal before the end position is reached (above 85% spool stroke).

The switch can only be located on the opposite side of the solenoid for direct operated valves.

The flow curve diagram shows the flow versus pressure drop curves for all spool types. The relevant curve number for each spool type, operating position and flow direction is given in the table below.

Spool	Position „b“		Position „a“		Position „0“

Flow curve diagram

Shift limit diagram

The diagram below specifies the shift limits. Valves with spool position “F” or “M” can only be operated up to 70% of the limits. The specifications apply to a viscosity 35mm²/s and balanced flow conditions. The shift limits can

be considerably lower at unbalanced flow conditions. To avoid flow rates beyond the shift limits, a plug-in orifice can be inserted in the P-port.

The space necessary to remove the plug per EN 175301-803, design type AF is at least 15 mm.
The torque for the screw M3 of the plug has to be 0.5 to 0.6 Nm.

Attention

The adjustment of the position control is factory set and sealed. Replacement and repairs can only be undertaken by the manufacturer.

The D3MW is a solenoid operated directional control valve size NG10 in 3-chamber design. It is direct operated by wet pin solenoids.

The D3MW is designed for mobile and marine applications. It is based on the D3W series, but offers additional corrosion protection of the valve body, the solenoid coil and the anchor tube as well as the typical solenoid connections for the mobile market such as AMP Junior Timer.

2

Technical features:

- High corrosion protection
- Solenoid connection:
 - Standard (as per EN175301-803)
 - AMP Junior Timer
- Robust design for rough applications

D3MW_UK.INDD CM_22.01.2008.1

The pilot operated directional valves are available with both Parker (series D31DW, D41VW, D81/D91VW and D111VW) and Denison (series 4D02V, 4D03, 4D06) model codes. All valves are pilot operated by an NG6 valve.

Pressure and flow of the pilot oil have a significant influence on the response time of the spool in the main stage.

In order to guarantee a save switching of the spool please choose the appropriate pilot oil supply and drain option. (Spools with a connection P to T need an external pressure supply or an integral check valve. For spools with negative cross-over position the same options are recommended.)

The minimum pilot pressure must be ensured for all operating conditions of the directional valve.

Definitions

Start position monitored:

The valve is de-energized. The inductive switch gives a signal at the moment (below 15% spool stroke) when the spool leaves the spring offset position.

End position monitored:

The inductive switch gives a signal before the end position is reached. (above 85% spool stroke).

The flow curve diagram shows the flow versus pressure drop curves for all spool types. The relevant curve number

for each spool type, operating position and flow direction is given in the table below.

Integral check valve in the P port

Mounting an integral check valve in the P port is necessary to build up pilot pressure for valves with P to T connection and internal pilot oil supply. The pressure

difference at the integral check valve (see performance curves) is to be added to all flow curves of the P-port of the main valve. Directional valves with an integral check valve are available for the series 4D02V, D41/4D03 and D81/4D06.

The D1VP is a hydraulically controlled 4/3 or 4/2 way directional control valve. The valve can be operated either by the pilot ports X and Y via the subplate or by the connection of an external pilot pipe directly on the valve body.

The D3DP, D4P, D9P and D11P are hydraulically controlled 4/3 or 4/2 way directional control valves. The valves are operated by the pilot ports X and Y via the subplate. Pressure and flow of the pilot oil have a significant influence on the response time of the spool.

The minimum pilot pressure must be ensured for all operating conditions of the directional valve.

The D1DL, D3DL, D4L and D9L are 5 chamber 4/3 or 4/2 way directional control valves. They are operated by a hand lever which is directly connected to the spool.

The hand lever can be located either on the A or B side. Spring offset and detent designs are available.

Characteristics

**Direct Operated Proportional DC Valve
Series D1FB**

The D1FB directional control valve of the nominal size NG6 (CETOP3) provides variable flow rates.

Due to a spool/sleeve combination with wire EDM window geometry and a special manufacturing adjustment, the valve achieves excellent repeatability from valve to valve and high precision. The D1FB is suited for standard applications particularly with regard to functions on identical machines, which need only to be adjusted once. In combination with the digital power amplifier PWD00A-400, the valve parameters can be saved, changed and duplicated.

Technical features

- Spool/sleeve design
- High repeatability from valve to valve
- Low hysteresis
- Manual override
- Fail-safe centre position

Characteristics

**Direct Operated Proportional DC Valves
Series 4DP01, 4DPE01 (Denison)**

The proportional directional valves 4DP01 and 4DPE01 (NG06) are offered under Denison brand name.

The spool in body design provides high flow rates at a good level of precision. The 4DPE01 series has a 3-chamber body and is suitable for basic proportional functions such as following a flow profile with acceleration and deceleration ramps.

In combination with the digital power amplifier PWD00A-400, the valve parameters can be saved, changed and duplicated.

3

Characteristics

The D1FT directional control valve of the nominal size NG6 (CETOP 3) is a proportional valve providing variable flow rates.

This valve is used with integrated control electronics. Typical applications are soft switching via adjustable ramps for the reduction of hydraulic and mechanical shocks, and electrically adjustable flow rates / speeds for automating machine functions.

Technical features

- Integrated control electronics with ramp adjustment
- Progressive flow characteristics for sensitive adjustment of flow rate
- Spring centred spool
- Manual override

Characteristics

The D*1FT pilot operated proportional DC valves are available in sizes NG10 (CETOP05), NG16 (CETOP07) and NG25 (CETOP08).

The D*1FT onboard electronics offers features as adjustable ramps and overlap compensation.

Typical applications include reproducible control of actuator speed in rapid / slow speed profiling, and smooth acceleration and deceleration performance.

Technical features

- Progressive flow characteristics for sensitive adjustment of flow rate
- Fail-safe centre position
- Center position monitoring optional

Characteristics

**Pilot Operated Proportional DC Valve
Series D*1FH**

The pilot operated proportional DC valves series of the D*1FH series are high-performance valves with electronic spool position feedback. These valves are available in sizes NG10 to NG32 (CETOP05 to CETOP10).

Typical applications are:

High precision and reproducible adjustment of flow rates, applications in rapid / creep speed with spool position monitoring for presses and dynamic position and p/Q closed loop systems.

Technical features

- Very low hysteresis
- Zero lap and overlap spool design available
- High dynamics
- Spool position feedback
- Center position monitoring optional

DFH_UK.INDD CM_28.01.08.1

Characteristics

**Direct Operated Proportional DC Valve
Series D1FP**

The direct operated control valve D1FP of the nominal size NG06 (CETOP03) shows extremely high dynamics combined with maximum flow. First of all it is used for highest accuracy in positioning of hydraulic axis and controlling of pressure and velocity.

Driven by the new patented VCD® actuator the D1FP reaches the frequency response of real servovalves. Compared with solenoid driven valves the D1FP can also be used in applications with pressure drops up to 350bar across the valve. Because of the high flow capability the D1FP can be a substitute for NG10 valves in some cases.

A loss of the power supply lets the spool move in a defined position. All common input signals are available.

Technical features

- Real servovalve dynamics (-3dB/350Hz at ±5% input signal)
- No flow limit up to 350 bar pressure drop through the valve
- Max. tank pressure 350 bar (with external drain port y)
- High flow
- Defined spool positioning in case of power supply breakdown
- Onboard electronics

D1FP_UK.INDD CM_28.01.08.1

The direct operated control valve D1FP*S of the nominal size 04 (ISO 10372) shows extremely high dynamics combined with maximum flow. The valve mounting pattern is designed to replace servovalves of size 04 (ISO 10372) with the D1FP*S.

Driven by the new patented VCD® technology the D1FP*S shows all advantages of the DFplus® series as robustness, high dynamics and no flow limit up to 350 bar. Additional features are low leakage and a defined spool position in case of power supply breakdown.

Maintenance and contamination restrictions correspond to common solenoid driven valves and pilot supply is not required. All common input signals are available.

Technical features

- Servovalve size 04 (ISO 10372) mounting pattern
- Real servovalve dynamics (-3db/350Hz with ± 5% input signal)
- Low leakage
- No flow limit up to 350 bar pressure drop through the valve
- Max. tank pressure 350 bar (with external drain port y)
- High flow
- Defined spool positioning in case of power supply breakdown
- Onboard electronics

¹⁾ For applications with p_T>35 bar the Y-port has to be connected and the plug in the Y-port has to be removed.

²⁾ Flow rate for different Δp per control edge:

$$Q_x = Q_{Nom.} \cdot \sqrt{\frac{\Delta p_x}{\Delta p_{Nom.}}}$$

³⁾ Measured with load (100 bar pressure drop/two control edges)

Functional limit* (at 100% command signal)

* When exceeding the functional limits, for a period of time the valve will go into fail safe and power supply needs to be switched off/on to re-enable the valve.

Characteristics

Pilot Operated Servo Proportional DC Valve Series D*1FP

The new series of pilot operated servo proportional valves D*1FP transfers the advantages of the Parker patented Voice Coil Drive (VCD®) to larger frame sizes and thus high flow rates. The high dynamic / high precision drive of the pilot valve allows the optimum control of the main spool and results in servo class performance of the complete valves.

The D*1FP series is available in 5 sizes:

D31FP NG10 (CETOP05)

D41FP NG16 (CETOP07)

D81FP NG25 (CETOP08) for port diam. up to 26 mm

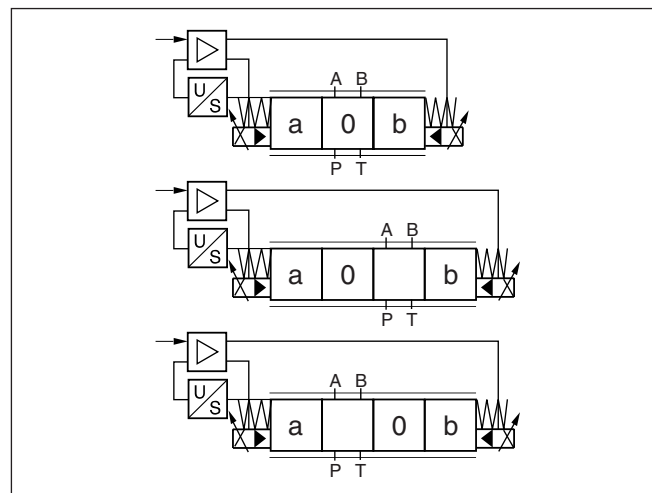

D91FP NG25 (CETOP08) for port diam. up to 32 mm

D111FP NG32 (CETOP10)

The new safety concept works with a safe 4th position of the D1FP pilot valve. This ensures that the main stage is hydraulically balanced at power down and allows to have the main spool spring centred (for overlapped spools) or approximately 10% spring offset to spool position A or B (for zerolap spools).

Technical features

- High dynamics
- High flow
- Defined spool positioning in case of power supply breakdown
- Onboard electronics
- Closed loop position – controlled pilot valve and main stage

Chapter 10: Valves for Pipe Mounting

The pressure relief valve VS*06 is a direct operated spool valve for subplate mounting with internal drain to port T. The connection and function is according to ISO 6264.

Function

- Spool type valve
- Subplate mounting according to ISO 6264
- 5 pressure stages
- 2 adjustment modes
- Gauge port

Characteristics

Pilot operated relief valves of the series VBY consist of a pilot with manual adjustment and a spool type main stage. The valves need to be externally drained.

The series VBY can also be used as pressure sequence valve, because of the high pressure capability in the outlet port and the external drain port.

Features

- Subplate mounting acc. to ISO 5781
- Main stage spool type
- Pilot stage seated type
- 4 pressure stages
- 2 adjustment modes
 - screw with hexagon socket
 - Key lock

The direct operated pressure relief valve series EVSA is a seated type valve for screw-in mounting. It is available in two sizes and three pressure stages.

Function

When the pressure in port P exceeds the setting pressure the cone opens to port T and thus limits the pressure in port P to the adjusted level.

The integrated damping spool prevents pressure fluctuations in the transition region. The pressure is set by the adjusting screw, which is locked by the clamping screw. The setting can optionally be secured by a cylinder lock (key lock).

Features

- Seated type valve
- Screw-in mounting
- 3 pressure stages
- 2 adjustment modes
 - screw with lock nut
 - key lock

Note

The spring must be unloaded when the EVSA is screwed out of the manifold.

Characteristics

Direct Operated Pressure Relief Valve Series R1E02 (Denison)

Direct operated pressure relief valves series R1E02 are seated type valves typically used for remote pressure controls. In applications where the reliability and simplicity of a hydraulic remote control are preferred to an electro-hydraulic system the R1E02 series is an ideal solution.

Typically pilot operated pressure valves or compensators of variable pumps are controlled.

Features

- Seated type valve
- 3 body variants:
 - foot mounting
 - front panel mounting
 - subplate mounting
- 3 pressure stages
- 3 adjustment modes:
 - hand knob
 - acorn nut with lead seal
 - adjusting with lock

Characteristics

Pilot operated pressure relief valves are available with both Parker (series R/RS) and Denison (series R4V/R6V) model codes.

A manually adjusted pilot stage controls a seated type main stage.

A vent function with a solenoid operated directional valve is available for circulation at minimum pressure.

Features

- Pilot operated with manual adjustment
- 2 interfaces
 - Subplate ISO 6264 (DIN 24340 Form D) with VV01 vent valve
 - Subplate ISO 6264 (DIN 24340 Form E) with Cetop 03 vent valve
- 4 pressure stages
- 3 adjustment modes
 - hand knob
 - acorn nut with lead seal
 - Key lock
- Remote control via port X

RS25R

Function:

Series R

System pressure in port P is applied via the X gallery to the spring loaded cone in the pilot head. The pilot head controls the pressure in the Z area on top of the main cartridge which is additionally kept close by the main spring.

If the pilot pressure exceeds the setting pressure the pilot cone opens and thus limits the pilot pressure.

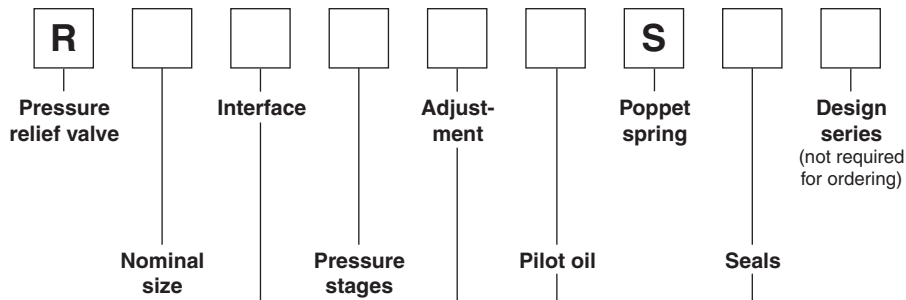

When the system pressure exceeds the pilot pressure plus the spring force, the main cartridge opens to port T and limits the pressure in port P to the adjusted level.

Series RS

Additionally to the relief function of series R, a solenoid operated vent valve connects the Z area to tank. This allows oil circulation from P to T at minimum pressure drop. The vent valve can either be a standard Cetop 03 valves (mounting form E) or a sandwich unit (mounting form D). For both types the vent position can be either at the energized or de-energized solenoid.

The pilot operated pressure relief valves series DSDU limit the system pressure by opening the pressure port to the tank. They are mostly used for accumulator pressure relief. The valve is set and sealed by the German technical monitoring association TÜV. The valve delivery includes a copy of the TÜV certificate.

Direct operated proportional pressure relief valves are available with both Parker (series RE06M*W) and Denison (series 4VP01) model codes.

Function

When the pressure in port P (or A for RE06M*W) exceeds the pressure setting at the solenoid, the cone opens to port T and limits the pressure in port P to the adjusted level. The optimum performance can be achieved in combination with the digital amplifier module PCD00A-400.

Features

- Direct operated by proportional solenoid
- Very low pressure adjustment of p_{min}
- 2 pressure ports, A and P for RE06M*W
- 1 pressure port for 4VP01
- Subplate mounting according to ISO 6264
- 4 pressure stages

Note

The RE06M*W series is equipped with two pressure ports (port P and A). The solenoid is located on the B port side of the mounting pattern.

The 4VP01 series is equipped with one pressure port (port P). The solenoid is located on the A port side of the mounting pattern.

The proportional pressure relief valve series RE06M*T is direct operated seated type valve for subplate mounting with on-board electronics.

Function

When the pressure in port P or A exceeds the pressure setting at the solenoid, the cone opens to port T and limits the inlet pressure to the adjusted level.

The pressure adjustment is effected by applying current to the solenoid. The control signal is modulated to the solenoid current by the electronics.

Features

- Direct operated pressure relief valve
- Onboard electronics
- Ramp line adjustment
- Characteristics linearized
- Very low pressure adjustment of p_{min}
- Subplate mounting acc. to ISO 6264
- 4 pressure stages
- 2 pressure inlet ports A and P

Characteristics

Proportional pressure relief valves for external electronics are available with both Parker (series RE*W) and Denison (series R*V) model codes.

A proportionally adjusted pilot stage controls a seated type main stage. The valves are equipped with a mechanical maximum pressure stage (optional for RE*R*W and R6V).

The optimum performance can be achieved in combination with the digital amplifier module PCD00A-400.

Features

- Pilot operated with proportional solenoid
- Continuous adjustment by proportional solenoid
- 2 interfaces: subplate, ISO 6264 (DIN 24340 Form D + Form E)
- 4 pressure stages
- Optional mechanical maximum pressure adjustment (for RE*R*W and R6V)

RET_R4V-R6V_UK.INDD CM_29.01.2008.1

Pilot operated relief valve with proportional adjustment. Series VBY*K is a pilot operated pressure valve with external drain. The external drain allows an application as sequence and as pressure relief valve. For use as pressure relief valve observe hydraulic connection.

The optimum performance can be achieved in combination with the digital amplifier module PCD00A-400.

Features

- Proportional adjustment
- Subplate mounting acc. to ISO 5781
- External drain
- Main stage spool type valve
- Pilot stage seated type valve

Characteristics

Subplate mounted unloading valves are available with both Parker (series UR/US) and Denison (series R4U) model codes.

These valves are used to unload a circuit at low pressure. The mechanically adjustable pressure signal to unload the main stage has to be applied to port X. The pressure differential between opening and closing is nominal 15 or 28 % of the setting pressure.

28 % for pressure stages bar 105, 210

15 % for pressure stages bar 350

Typical applications are unloading of pumps in an accumulator circuit or unloading of the low pressure stage of a double pump.

In addition, the US series is vented by electrical operation.

Features

- Pilot operated unloading valve
- Interface
 - subplate mounting to ISO 5781
- 3 pressure stages
- 2 switching types (series US)
- 3 adjustment modes
 - hand knob
 - acorn nut with lead seal
 - Key lock

Subplate mounted sequence valves are available with both Parker (series S) and Denison (series R4S) model codes.

These valves enable a hydraulic system to operate in a pressure sequence. When the system pressure reaches the setting pressure the valve opens and permits flow to the secondary sub-system.

Features

- Pilot operated sequence valve
- Subplate mounting acc. to ISO 5781
- 4 pressure stages
- 3 adjustment modes
 - hand knob
 - acorn nut with lead seal
 - Key knob

Characteristics

**Direct Operated Pressure Reducing Valve
Series VM**

Direct operated pressure reducing valve with manual adjustment. Series VM is a direct-controlled, spring loaded 3 way pressure reducing valve, that is open in neutral position. The valve closes the connection when the pre-set pressure is exceeded.

Primary port: NG06 -P, NG10 - B

Secondary port: NG06 - A, NG10 - A

Tank port: NG06 - T, NG10 - Y

If the pressure increases due to an external influence the spool opens to port T until the pre-set pressure is reached.

Features

- Spool type valve
- Subplate mounting acc. to ISO 5781
- 5 pressure stages at NG06
- 3 pressure stages at NG10
- 2 adjustment modes

Subplate mounted pressure reducing valves are available with both Parker (series PR) and Denison (series R4R) model codes.

These valves are used to control the pressure in the secondary part of the hydraulic system. Independent of the primary pressure the secondary pressure is reduced to the pressure setting. In order to avoid undesired motion the valves are normally closed.

Features

- Pilot operated with manual adjustment
- Subplate mounting acc. to ISO 5781
- Normally closed to avoid unintended motion
- 4 pressure stages
- 3 adjustment modes
 - hand knob
 - acorn nut with lead seal
 - Key lock

PR-R4R_UK.INDD CM_29.01.2008.1

Proportional pressure reducing valves of the series VMY allow the variable adjustment of the reduced pressure from 0 bar up to the nominal pressure.

The valve consists of a spool type main stage and a proportionally operated pilot stage. The desired pressure can be variably set corresponding to the command signal specified on the amplifier. The proportional solenoid converts the current of the amplifier into force on the valve poppet of the pilot stage.

Typical applications are pressure systems, test equipment, or counterweight systems.

The optimum performance can be achieved in combination with the digital amplifier module PCD00A-400 for open loop systems or with PWDXXA-40* for closed loop systems.

Function

With the proportional solenoids de-energized the main spring forces the main spool into the neutral position. Port A is connected to port T. Thus the reduced pressure only depends on the back pressure in the external drain pipe and/or the tank pressure and can accordingly be reduced down to 0 bar. The pressure present in the P line delivers the pilot oil to the pilot stage via a flow control valve.

When the proportional solenoid is energized, the pilot pressure is increased in the pilot pressure area, and the main spool moves against the spring until the connection P - A opens. The regulation of the reduced pressure on connection A takes place by the constant comparison of the actual pressure and the reference pressure of the pilot stage.

Subplate mounted proportional pressure reducing valves are available with both Parker (series PE*W) and Denison (series R4R) model codes.

These valves have a proportional solenoid operated pilot stage and a cartridge main stage.

The optimum performance can be achieved in combination with the digital amplifier module PCD00A-400.

Features

- Pilot operated with proportional solenoid
- Continuous adjustment by proportional solenoid
- Subplate mounting according to ISO 5781
- 3 pressure stages
- Mechanical maximum pressure adjustment

Characteristics / Ordering Code

Manatrol needle valve with steel body as screw-in valve for block insertion, optionally with a 30° taper-fine, V-notch or micro-fine rectangular slot. The form of the metering opening influences the accuracy of the flow adjustment, which is pressure and viscosity dependent. The needle is made of stainless steel and fits into a ring gap in the valve cartridge. For details of cutting tools for reaming the block bore, see 'Accessories' at the end of this chapter.

Manatrol shut-off and metering valves with 2 stage needle cone. Fine adjustment for the first stage can be achieved with 3 rotations of the adjustment knob. The second stage with normal throttle characteristics is achieved with 3 further rotations.

A cylindrical needle with a rectangular slot is provided to reduce the viscosity effect for sizes 400 and 600. The flow is dependent on pressure and viscosity.

Characteristic values

Manatrol throttle check valves of series FS allow the adjustment of the flow for a defined direction.

A 2 stage needle allows for very exact setting of smaller flow rates with the first 3 rotations of the adjustment knob. After 3 more rotations, the valve is completely open. The valve setting can be locked by a locking screw.

**Flow Control Valve
Series PC*MS**

Manatrol 2 way flow control valves for pressure compensated regulation of the flow. As a consequence of pressure changes, the set value can vary by ± 5% within the tolerance range. Changes in viscosity and in temperature have the same effect and are to be observed.

The series PCCMS is additionally equipped with a built-in check valve for the return flow.

Characteristic values

PCMS_UK.INDD CM_18.01.2008.1

5

Characteristics

2 way flow control valves are used to provide pressure compensated flow. The valve design also compensates temperature and viscosity variations to a certain extent.

Optionally the flow from A to B can be blocked by external pilot pressure applied to port P (option X). This can be used to avoid unintended initial movements of actuators.

The GFG is optionally equipped with a built-in check valve for the return flow.

Design

The 2 way flow control valves are fitted with a triangular flow restrictor and a subsequent pressure compensator. The setting of the flow rate can be locked by a key lock in the adjusting knob against unauthorised adjustment (option C).

Function

The fluid enters through port A through the flow restrictor. Downstream of the flow restrictor the pressure compensator is located. The control edges are provided by four radial bores in the poppet, which are fully open to port B in the neutral position.

This can cause a short non-compensated flow when the valve is initialized.

Optionally the compensator spool can be held in closed position by external pilot pressure in port P (option X).

The flow adjustment is done via the flow resistor which is adjusted by the hand knob. The adjusting angle of the hand knob is 270°.

Features

- Flow rate independent of pressure, temperature and viscosity
- Available for 7 different flow rates
- Good fine adjustment
- Optional reverse flow check valve
- Turn knob with key lock (option C)

Note

Rectifier plate see 'Accessories' at the end of this chapter.

Characteristics / Ordering Code

2 way flow control valves series 2F1C provide pressure and viscosity compensated flow from port A to port B. The counter direction is blocked (standard) or can be open via an integral reverse flow check valve (optional).

Function

The compensator spool is located in front of the metering spool. The metering spool is closed in the neutral position to avoid undesired initial actuator motion. The oil flow to open the metering spool has to pass a needle valve (not shown in the sectional drawing). The needle valve can be adjusted from the front panel to set the response time of the 2F1C.

The metering spool is adjusted by the main control knob. The key lock has three positions:

- Lock: Adjustment is locked.
- Adjust: Full adjustment is permitted.
- Trim: Fine adjustment of +/- 5% is possible.

Features

- 2 way flow control valve
- Subplate mounting according to ISO 6263
- Excellent fine adjustment
- Adjustable response time
- Closed in neutral position
- Optional reverse flow check valve
- 2 sizes, NG10 (3/8"), NG16 (3/4")

Characteristics

Proportional flow control valves of the series DUR*L06 are used to generate pressure-compensated flow from A to B. The valve is equipped with a built-in check valve for the return flow.

For meter-in and meter-out control of an actuator a rectifier plate can be used. See 'Accessories' at the end of this chapter.

Function

When solenoid current is applied, the metering spool opens against the reset spring and the flow is regulated by the pressure compensating spool to port B.

With the aid of the pressure compensating spool, the pressure drop is held constant on the metering window. Thus pressure load changes are compensated, and the oil flow remains constant.

In combination with the digital electronic module PC-D00A-400 the valve parameters can be saved changed and duplicated.

Technical features

- Low hysteresis
- High reproducibility
- Load-independent oil flow
- Bypass check valve
- Mounting pattern to ISO 6263
- 5 flow rates

Sandwich rectifier plate for the model GFG 2

If a 2 way flow control valve is used in combination with a rectifier plate the valve can be used for meter-in and meter-out flow control of an actuator.

Design

The intermediate rectifier plate is designed with 4 identical, symmetrically arranged check valves. Thus the differential pressure is the same in both flow directions.

¹⁾ Thread runout x must be maintained. It may be smaller, but not larger (requirement for a perfect seal using the O-ring).

²⁾ Fully cut-out thread

Characteristics / Ordering Code

Manatrol check valves of the series CS for subplate mounting provide free flow in one direction and block flow in the counter direction.

Specific Manatrol poppets and poppet guides ensure reliable functional integrity even at high flow rates and/or pulsations.

The check valves series SPZBE are slip-in cartridge valves. The function unit is fixed inside the manifold by a hexagonal plug with slot. The design is based on CE series with same poppet and sleeve. The different mounting cavity has to be considered.

Features

- Little space required
- Leak-free from port B to A
- 4 different opening pressures

Characteristics

**Check Valves
Series SPR (Parker), C4V (Denison)**

Direct operated check valves are available with both Parker (series SPR) and Denison (series C4V) ordering codes.

Check valves allow free flow from A to B. The counter direction is blocked. The SPR/C4V series are equipped with a leak-free seat type cartridge.

Function

The pressure arising in port A lifts the poppet from the valve seat and releases the flow to B. In the counter direction, the spring and the pressure on top of the cartridge hold the poppet onto the seat and block the flow.

Pilot operated check valves of the series CPS allow free flow in one direction (A to B).

The counter-flow direction (B to A) is blocked. By applying pilot pressure, the poppet can be lifted from its seat against the pressure in port B. Thus flow in the counter-direction is also possible. There are 1 and 2 stage poppets available with pilot ratios of 5 : 1 and 40 : 1, to suit different operating conditions. The CPS needs to be externally drained via port L.

Technical data

Size		600	1200

Characteristics

**Directional Seat Valve
Series D4S (Denison)**

Seat valves series D4S are designed for directional control functions. A large variety of poppets, springs and covers - including shuttle valves, stroke limiters, solenoid valves (VV01) and position control - allow to design individual hydraulic solutions for nominal flow up to 600 l/min.

A complete program is offered under the Denison brand: subplate mounted valves (D4S - chapter 6), SAE flange valves (D5S - chapter 9), pipe mounted valves (D4S - chapter 10), slip-in cartridges (CAR - on request).

Features

- Subplate mounting acc. to ISO 5781
- Leak-free seat valve design
- Numerous pilot options
- 6 poppet types
- 3 sizes, NG10, 25, 32

Dimensions D4S stroke limiter

Note:
Stroke limiter not for use with D4S03, vent valve VV01, shuttle valve and position control.

Example: D4S⁰⁶₁₀-23-3B.

Characteristics

Hydraulically Pilot Operated Check Valves Series SVLE (Parker), C4V (Denison)

Pilot operated check valves are available with both Parker (series SVL) and Denison (series C4V) model codes. Hydraulically pilot operated check valves allow free flow from A to B. The counter-flow direction is blocked.

When pressure is applied to control port X, the ring chamber flow from B to A is released.

Up to four different pilot control ratios are available (see ordering code).

Function

When no pressure is applied to the X-port, the flow from B to A is blocked, because the pressure in B is also in effect on top of the poppet.

Pressurizing the X port relieves the area on top of the poppet to the drain port and allows flow from B to A.

The seat design of the SVL valve series provides leak-free separation of port A and B in the closed position.

Characteristics

Pressure relief valves series RDM are direct operated piston type valves with low hysteresis. They can be used as P-T relief or as T-T controlled counter balance valve. The valve body is equipped with a pressure gauge port.

Function

PT... pressure is relieved from P to T at the adjusted value.

TT... pressure is relieved from T' to T at the adjusted pressure.

Features

- The direct operated, cushioned piston design results in fast response, low leakage and minimal hysteresis.
- Up to 5 pressure adjustment ranges are available with max. pressure settings of:
bar 25, 64, 160, 210, 350 for RDM2,
bar 19, 50, 100, 150, 210 for RDM3.
- Adjustment modes:
- Slotted head with lock nut
- Key lock
- Turning knob
- RDM2 - NG06 (CETOP3)
RDM3 - NG10 (CETOP5)

Characteristics

The pilot operated pressure relief valves from the Parker Manapak series RM are in sandwich design for easy configuration of stack systems. Depending on type, pressure limiting can be achieved in ports P, A or B with unloading to port T.

RM valves may only be mounted in the defined mounting position.

Features

- The valve bodies of the Parker Manapak valve series RM are made of steel.
- The pressure can be set by slotted head screw, knob, or knob with DIN-lock.
- Piloting results in a flat p/Q performance curve.
- The orifices located in the main spool limit the pilot oil flow.

Characteristics

Pressure Relief Valve Series ZDV (Denison)

Pilot operated pressure relief valves series ZDV are designed for maximum flow rates.

The relief function can be located between P and T, A and T, B and T or A and T + B and T for typical pressure relief functions.

For a pre-charge function the ZDV can be ordered with pressure function between A and B + B and A.

Characteristics

Series PRDM are direct operated pressure reducing valves to regulate pressure in one area of a hydraulic circuit at a predetermined level below normal system pressure. Additionally, an integral pressure relieving function for the secondary reduced pressure circuit is incorporated into the design.

Function

These valves are "normally open" devices that allow fluid to flow through the controlled port during their non-actuated or "at rest" condition. When downstream pressure exceeds the value set by the spring force, the control piston moves off its seat, closing off the flow path and thus reducing the fluid passing through from the main system. The cushioned piston modulates to maintain the preset pressure in this branch of the hydraulic circuit. If, due to external forces, the pressure continues to rise in this branch circuit, the piston will keep moving against the spring force allowing fluid to be drained to the tank, thereby limiting maximum pressure to the valve's setting.

Features

- PRDM Manapak sandwich valves may be selected to reduce pressure in the 'P', 'A' or 'B' port.
- The direct operated, cushioned piston design results in fast response, low leakage and minimal hysteresis.
- Up to 5 pressure adjustment ranges are available with max. pressure settings of:
bar 25, 70, 160, 210, 350 for PRDM2,
bar 19, 50, 100, 150, 210 for PRDM3.
- Adjustment modes:
 - Slotted head with lock nut
 - Key lock
 - Turning knob
- PRDM2 - NG06 (CETOP 3)
PRDM3 - NG10 (CETOP 5)

Characteristics

The pilot operated pressure relief valves from the Parker Manapak series PRM are in sandwich design for easy configuration of stack systems. The reducing function is located in port P except for size NG10 (PRM3 AA and BB, see ordering code).

The pressure reduction for the desired connecting port is achieved by internal connections of the pilot and drain lines with the corresponding channels.

Pilot Operated Pressure Reducing Valve Series PRM

PRM3PP

PRM6

Features

- The valve bodies of the Parker Manapak valve series PRM are made of steel.
- The control pressure range can be set by slotted head screw, knob, or knob with Key lock.
- Pressure gauge/measuring connections are available in the valve body.
- Piloting results in a flat p/Q performance curve.
- PRM3 - NG10 (CETOP 5)
- PRM4 - NG16 (CETOP 7)

7

Proportional pressure reducing valves keep a constant pressure p_{red} on the secondary side - independent of pressure fluctuations on the primary side. The integrated pressure relief function obviates the need for an additional pressure relief valve on the secondary side and reliefs to tank, if p_{red} rises above the setting pressure.

The proportional pressure reducing valve reduces the pressure in output port p_{red} in proportion to the solenoid

current. The PRPM works practically independent of the inlet pressure p_E . In non-activated mode, the connection to the tank is fully open with a min. pressure corresponding to the spring force.

The gauge port is connected to the secondary side. Types A and B have an integrated bypass check valve. The PRPM provides optimum performance in combination with a digital amplifier module PCD00A-400.

Characteristics

2-way pressure compensators series LCM are sandwich plate valves designed for stacking beneath a proportional directional control valve with a standardised mounting pattern.

The valve maintains a constant pressure differential between ports P and A or P and B across the directional valve. When the cross sectional opening of the directional valves is held steady, a constant flow rate is achieved, regardless of consumer load fluctuations.

The control pressure applied to the spring side of the compensator spool is supplied from port A or B via a shuttle valve. Flow rate regulation is automatically effective in the port with the highest pressure.

Pressure Compensator Series LCM

Application example

Proportional DC valve model D31FS with 2 way pressure compensator LCM3 maintains a constant flow rate.

The diagram shows the design according to code X.

Ordering Code

Dimensions

LCM2

Mounting screws: BK 403 (4 x M5 x 90)

For mounting screws connected with the directional valves D1 or D31.

LCM3

Mounting screws: BK 412 (4 x M6x 90)

The views show the mounting surface for the directional valve.

Characteristics

The sandwich type pressure compensators series SPC are typically used in combination with proportional directional control valves. The compensator keeps the pressure drop over the directional valve constant and thus provides load-independent flow to the actuator.

Features

- 2-way or 3-way pressure compensators
- Standard pressure differential 5 bar
- Adjustable differential (2...5 bar) and 10 bar - optional

Throttle Valve with Check Series ZRD (Denison)

Characteristics

Throttle check valves series ZRD are designed for maximum flow rates.

The throttle check function can be located in port A or B as well as in A + B. Meter-in or meter-out functionality can be selected by model code.

A low flow / high resolution version in NG06 for sensitive shifting time adjustment of pilot operated directional control valves is available on request.

Characteristics

Direct Operated Check Valve Series CM

Check valves from the Parker Manapak series CM are in sandwich design for easy configuration of stack systems. Depending on the function required, one or two check valves are arranged in ports P, T, A, and B. Number and flow direction can be selected from the ordering code.

Features

- The valve bodies of the Parker Manapak valve series CM are made of steel.
- Eight options for the arrangement of the check valve in the body offer a multitude of uses for hydraulic switching.
- The function can be changed by turning the valve.
- CM2 - NG06 (CETOP3)
CM3 - NG10 (CETOP5)

Characteristics

Pilot operated check valves from the Parker Manapak series CPOM are in sandwich design for easy configuration of stack systems. Depending on the function required, one or two pilot operated check valves are arranged in the ports A and/or B. The free flow direction is always from the valve side to the manifold side.

Function

The check valves open when flowing to the consumer side, where the opposing check valve is hydraulically-mechanically pilot operated simultaneously by a control spool, and thus the return flow is enabled from other consumer sides.

Features

- The valve bodies of the Parker Manapak valve series CPOM are made of steel.
- The valve poppet is precisely guided into the steel sleeve and ensures a good seal on the seat.
- When the valve poppet is open, the large cross-section allows high flow rates at low differential pressure.
- Different control ratios can be chosen with the NG6 and NG10 valves.
- Pre-opening for CPOM*HT to achieve smooth opening.

Characteristics

Pilot operated check valves series ZRE are designed for maximum flow rates and long life time.

The valves are typically used in combination with spool type directional control valves to ensure leak free positioning of the actuator.

The inlet flow is free while the outlet flow is blocked. Pressure in the inlet line opens the check valve and allows free outlet flow.

Mounting

Parker and Denison sandwich valves can be installed as desired. Each has a mounting pattern, whose dimensions correspond to the following standards.

- ISO 4401
- DIN 24430
- CETOP RP121
- NFPA

Mounting screws

Cylinder head bolts as per DIN 912/12.9, or studs as per DIN 835 10.9 with cylindrical nuts are used to mount the height stacking Manapak sandwich valves.

Bolt kits and tie rods see chapter 12, "Accessories".

Length of the mounting screws

The screw length is the sum of the engagement depth plus the stacking length. The stud length is the sum of the stacking length plus the thread depth of the nut.

Torques

The mounting screws or studs must be tightened with the prescribed tightening torque so that safety and proper seal are ensured.

See chapter 12 "Accessories" for BK bolt kits and TK tie rod kits.

Threads length

Characteristics

2 way slip-in cartridge valves are hydraulically controlled seat valves that are designed for compact block installation. Slip-in cartridge, cover, and pilot system are valve elements that permit single and combined functions.

Features

- Installation cavity and mounting pattern according to ISO 7368
- One sleeve only for all poppets
- 5 poppet shapes
- 5 poppet springs
- Optional seal between ports B and C
- Cover with adjustable stroke limitation for poppet
- Cover with mounting pattern for pilot valve assembly
- Combinations for complex functions
- Normally open cartridge (CE*F04)
- 8 nominal sizes NG16...NG100

Removal CE016 to CE063

The extracting tools consist of tee bar, slide hammer, support handle, and expanding collet (fig. 1).

At first the spacer ring is removed. Next, spring and poppet are withdrawn. Finally, the expanding collet is inserted into the sleeve and braced by means of the tee bar. Using the slide hammer, collet and sleeve are extracted from the cavity.

Removal CE080 to CE100

The extracting tools consist of spacer ring puller (fig. 4), puller (fig. 3), and puller thrust plate. At first the spacer ring is removed. Next the puller is inserted into the sleeve and aligned by the puller thrust plate. Tightening the nut then extracts the sleeve from the cavity.

Characteristics

The pressure relief valve series R consists of a manual adjustment pilot stage and a cartridge main stage.

The pressure relief valve series RS consists of a manual adjusted pilot stage with a directional valve for an electrically controlled vent function and a cartridge main part.

The R/RS*E model codes embrace the pilot valves, covers and cartridges that are also offered as separate items. See combination examples for details.

Features

- Pilot operated with manual adjustment
- Cavity and mounting pattern according to ISO 7368
- 4 pressure stages
- 2 switching types (series RS*E)
- 2 adjustment modes
 - Hexagon screw with lock nut
 - Key lock
- Remote control via port X
- 6 sizes, NG16 to NG63

Characteristics

**Proportional Pressure Relief Valve
Series RE*E*W**

The proportional pressure relief valve series RE*E*W consists of a proportional pilot stage and a slip-in cartridge main stage. A mechanical maximum pressure stage is optionally available. For sizes NG25 and NG32 a screw-in cartridge is used, for sizes NG40, NG50 and NG63 an additional sandwich unit.

The RE*W model code embraces the pilot valves, covers and cartridges that are also offered as separate items. See combination examples for details.

In combination with the digital power amplifier PC-D00A-400 the valve parameters can be saved, changed and duplicated.

Features

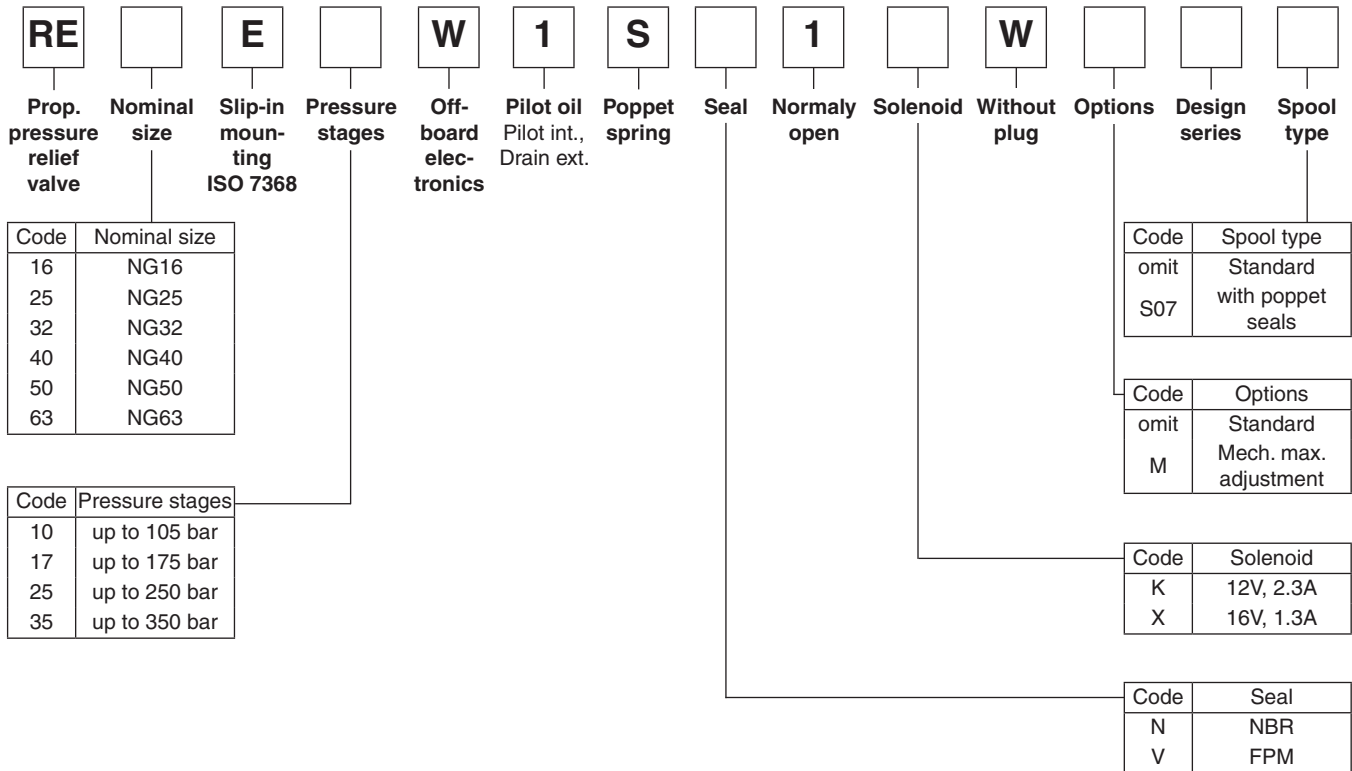

- Pilot operated with proportional solenoid
- Continuous adjustment by proportional solenoid
- Optional mechanical max. pressure stage
- Cavity and mounting pattern according to ISO 7368
- 4 pressure stages
- 6 sizes, NG16 to NG63

Characteristics

Proportional Pressure Relief Valve, OBE Series RE*E*T

The proportional pressure relief valve series RE*E*T consists of a proportional pilot stage with onboard electronics and a slip-in cartridge main stage. A mechanical maximum pressure stage is optionally available. For sizes NG25 and NG32 a screw-in cartridge is used, for sizes NG40, NG50 and NG63 an additional sandwich unit.

The valve comes factory set with linearized characteristics.

The RE*T model code embraces the pilot valves, covers and cartridges that are also offered as separate items. The pilot valve with onboard electronics (RE06M*T) is not shown in the combination examples.

Features

- Pilot operated pressure relief valve
- Onboard electronics
- Optional mechanical max. pressure stage
- Factory setting
- Ramp time adjustment
- Linearized characteristics
- 4 pressure stages
- Cavity and mounting pattern according to ISO 7368
- 6 sizes, NG16 to NG63

RE_E_T_UK.INDD RH_23.01.08

The unloading valve series UR*E consists of a mechanical pilot stage and a slip-in cartridge main stage. These valves are used to unload a circuit at low pressure. The mechanically adjustable pressure signal to unload the main stage has to be applied to port X. The pressure differential between opening and closing is 13%. In addition the series US*E is vented by electrical operation. The UR*E/US*E model codes embrace the pilot valves, covers and cartridges that are also offered as separate items. See combination examples for details.

Features

- Pilot operated unloading valve
- Cavity and mounting pattern according to ISO 7368
- 4 pressure stages
- 2 switching types (series US*E)
- 2 adjustment modes
 - hexagon screw with lock nut
 - Key lock
- 6 sizes NG16 to NG63

Characteristics

Accumulator discharge valves are preferably used in hydraulic systems where high volume flow rates are discharged from accumulators over a short operating period (in the range of milliseconds).

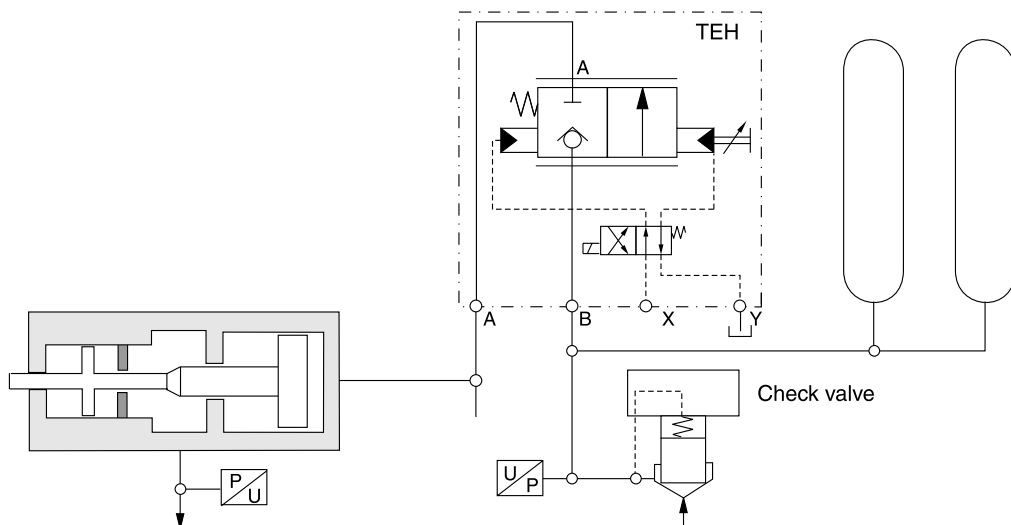

Typical applications are injection moulding and die casting machines as well as hydraulic presses.

The amplifier piston is pressed down onto the main poppet by pilot pressure in the X-line and pushes the main poppet into the seat. By switching the pilot valve the pilot pressure pushes the amplifier piston against the manual adjusted stroke limiter. The main poppet is forced by pressure in the B-line to follow the amplifier piston immediately and opens the adjusted area for flow from B to A. In the neutral position, the flow from B to A is blocked. With pilot pressure in X flow from A to B is blocked as well. Without pilot pressure oil can pass from A to B through the orifice in the poppet.

Throttle Valve with Shut-Off Valve Series TEH

TEH_UK.INDD RH_13.03.08

The 2/2 way proportional throttle valves series TDA are used to control large oil flows.

Features

- Cavity and mounting pattern according to ISO 7368
- Fail-safe function at power failure
- Leak-free from port B to A
- Pressure differential up to 350 bar possible
- 8 sizes NG16 up to NG100

Function

The TDA valve has a 3-stage design consisting of the first solenoid operated pilot stage with a spool in sleeve design, the second pilot stage with the control spring and the sequence spool and as main stage the poppet in the sleeve. The proportional solenoid operates the pilot spool against the feedback of the control spring and controls the position of the sequence spool. The main poppet follows the position of the sequence spool and provides an open area for flow from B to A (optional A to B) in proportion to the solenoid current. The poppet is positioned independent of the differential pressure, which can become as high as the maximum working pressure.

In combination with the digital power amplifier PC-D00A-400 the valve parameters can be saved, changed and duplicated.

TDA_UK.INDD RH_23.01.08

Characteristics

Accumulator discharge valves are preferably used in hydraulic systems where high flow rates are discharged from hydraulic accumulators over a short operating period (in the range of milliseconds).

Typical applications are injection molding and die casting machines as well as hydraulic presses.

Basically the function of an accumulator discharge valve corresponds to the function of a TDA throttle valve. In addition a directional valve is integrated in the pilot circuit to meet the relevant safety regulations.

The directional valve provides the safety function. When the solenoid is deenergized and the spring is in the end position, pilot pressure from X presses the control piston into lower end position and, the main poppet is closed. As a result the flow from B to A or from the reservoir system to the machine is blocked.

Characteristics

**Proportional Throttle Valve
Series TDL**

The 2/2 way proportional throttle valves series TDL are used in applications where high flow has to be precisely controlled with a very fast response time. Typical applications are die casting, injection moulding and hydraulic presses.

Function

The TDL valve has a 3-stage design consisting of the DFplus pilot valve, the hydraulic follow-up system with LVDT and the main stage with poppet and sleeve.

With the DFplus pilot valve the TDL achieves extremely fast response times: from 14ms (NG40) up to 22ms (NG100) with an adjustment precision of 0.5% of the nominal adjusted flow. The follow-up spool enables the poppet to be positioned independent of the differential pressure, which can become as high as the maximum working pressure.

The optimum dynamics are achieved at a control pressure >50 bar. The TDL has integrated electronics controlling both the position of the follow-up piston and the spool position of the DFplus pilot valve. All this makes the TDL a completely factory set unit with minimum or no need for on-site setting.

Features

- Pilot operated 2/2 way proportional throttle valve
- Cavity and mounting pattern according to ISO 7368
- For speed and position control
- Fast step response
- Flow direction B to A
- Completely adapted unit with integrated electronics
- Fail safe position
- 5 sizes NG40 up to NG100

Characteristics

**Hydraulically Pilot Operated Check Valve
Series SVLB**

Hydraulically pilot operated check valves allow free flow from A to B. The counter-flow direction is blocked.

When pressure is applied to control port X, the ring chamber flow from B to A is released. The pilot control ratio is 6:1.

Function

When no pressure is applied to the X-port, the flow from B to A is blocked, because the pressure in B is also effective on top of the poppet.

Pressurizing the X-port relieves the area on top of the poppet to the drain port and allows flow from B to A.

The seat design of the SVLB valve series provides leak-free separation of port A and B in the closed position.

Features

- Pilot operated check valve
- Cavity and mounting pattern acc. to ISO 7368
- Dampening poppet optional
- 5 sizes NG16 to NG50

The 2/2 way seat valves series C10 D*C are equipped with an inductive switch to monitor the closed position. After the poppet is lifted from the seat, the design of the poppet ensures that only a minimum amount of oil can pass the seat before the inductive switch changes the signal.

The poppet has a 60/40 area ratio ($A_A = 0.6 A_C$, $A_B = 0.4 A_C$) and is capable for flow from A to B and B to A.

Features

- German trade association certificate, No. 00 077
- Cavity and mounting pattern acc. to ISO 7368
- Monitored closed position
- Inductive switch CE conform
- Optional poppet sealing
- 6 sizes NG16 up to NG63

Ausstellungsdatum:
03.Januar 2007

Produktbezeichnung:

2/2- Wegesitzventil mit Überwachung
Einbauventil nach DIN 24342 (entspricht DIN ISO 7368)

Typ:

C10 DEC 101.....

Das geprüfte Baumuster entspricht den einschlägigen Bestimmungen der Richtlinie 98/37/EG (**Maschinen**).

Active 2/2 way monitored seat valves with cartridge design according to ISO 7368 are preferably used for safety circuits: mainly for safety guards, mould form tools and locking mechanisms for presses and injection moulding machines. Pilot pressure actively opens and closes the main poppet - independent of pressure in the main ports.

Features

- German trade association certificate, No. 00 078
- Cavity and mounting pattern acc. to ISO 7368
- Monitored closed position
- Inductive switch CE conform
- Active design with separate control surfaces
- Sealing between control surfaces and connection B
- 5 sizes NG25 up to NG63

Produktbezeichnung:

2/2- Wegesitzventil mit Überwachung
aktiv gesteuerte Einbauventile nach DIN 24342 (entspricht DIN ISO 7368)

Typ:

C18 DEC 107.....

Das geprüfte Baumuster entspricht den einschlägigen Bestimmungen der Richtlinie 98/37/EG (**Maschinen**).

Characteristics

**2 Way Slip-In Cartridge Valves
Series C18 DB**

Active 2/2 way seat valves with cartridge design according to ISO 7368 are preferably used where opening and closing should be controlled by pilot pressure only - independent of the pressure in the main ports.

The C18 DB series is offered as hydraulically controlled valve (C18 DB 107), with additional stroke limiter (C18 DBN 112) and with the mounting pattern for a pilot valve (C18 DB 121).

Features

- Cavity and mounting pattern acc. to ISO 7368
- Active design with separate control areas
- Sealing between control surfaces and connection B
- Up to 5 sizes:
 - C18 DB 107 - 5 sizes NG25 up to NG63
 - C18 DBN 112 - 3 sizes NG25 up to NG40
 - C18 DB 121 - 2 sizes NG32 up to NG40

Characteristics

Pilot operated pressure relief valves series R5V have a similar design to the subplate mounted R4V series. The SAE flanges allow to mount the valves directly on the outlet flanges of pumps or inlet flanges of actuators to achieve a very compact design.

Valves with SAE flanges can also be bolted together to combine functions without the need of a manifold block.

Features

- Pilot operated with manual adjustment
- R5V with 2-port body
 - 3 sizes (SAE ¾", 1", 1¼")
 - SAE61 flange
- R5V with 3-port body
 - 4 sizes (SAE ¾", 1", 1¼", 1½")
 - SAE61 and SAE62 flange
- 3 pressure stages
- 3 adjustment modes
 - Hand knob
 - Acorn nut with lead seal
 - Key lock
- With optional vent function

Characteristics

Pilot operated pressure unloading valves series R5U have a similar design to the subplate mounted R4U series. The SAE flanges allow to mount the valve directly on the outlet flanges of pumps.

A typical application is the unloading of a pump in an accumulator circuit. The combination of an R5U, C5V and R5V on a double pump generates a high pressure / low pressure pump system without the need of a manifold block or piping between the valves.

Features

- Pilot operated unloading valve
- 3-port body with SAE61 flange
- 4 sizes (SAE 3/4", 1", 1 1/4", 1 1/2")
- 3 pressure stages
- 3 adjustment modes
 - Hand knob
 - Acorn nut with lead seal
 - Key lock
- With optional vent function

Characteristics

**Pilot Operated Sequence Valve
Series R5S (Denison)**

Pilot operated sequence valves series R5S have a similar design to the subplate mounted R4S series. The SAE flanges allow to mount the valve directly on the inlet flanges of actuators or outlet flanges of pumps to achieve a very compact design.

Features

- Pilot operated with manual adjustment
- 3-port body with SAE61 flange
- 3 sizes (SAE 3/4", 1", 1 1/4")
- 3 pressure stages
- 2 adjustment modes
 - Hand knob
 - Acorn nut with lead seal

Characteristics

**Pilot Operated Pressure Reducing Valve
Series R5R (Denison)**

Pilot operated pressure reducing valves series R5R have a similar design as the subplate mounted R4R series. The SAE flanges allow to mount the valves directly on the inlet flanges of actuators to achieve a very compact design.

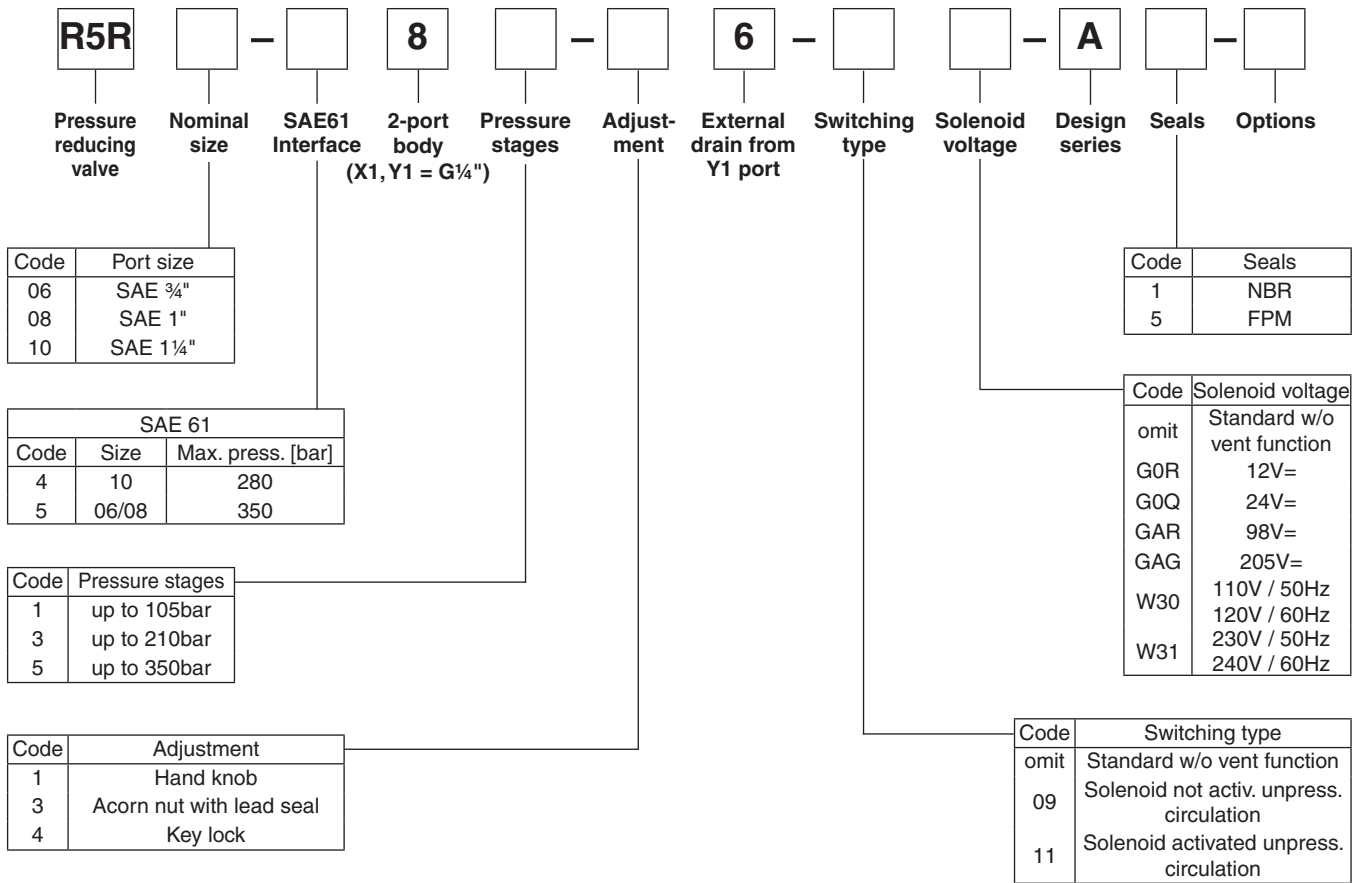

Features

- Pilot operated with manual adjustment
- Normally closed to avoid unintended motion
- 2-port body with SAE61 flange
- 3 sizes (SAE 3/4", 1", 1 1/4")
- 3 pressure stages
- 3 adjustment modes
 - Hand knob
 - Acorn nut with lead seal
 - Key lock
- With optional vent function

Characteristics

Proportional pressure relief valves series R5V*P2 are based on the mechanical adjusted series R5V. The additional proportional unit between the mechanical pilot valve and the main stage allows continuous pressure adjustment.

The optimum performance can be achieved in combination with the digital amplifier module PCD00A-400.

Features

- Pilot operated with proportional solenoid
- Continuous adjustment by proportional solenoid
- R5V with 2-port body
 - 3 sizes (SAE 3/4", 1", 1 1/4")
 - SAE61 flange
- R5V with 3-port body
 - 4 sizes (SAE 3/4", 1", 1 1/4", 1 1/2")
 - SAE61 and SAE62 flange
- 3 pressure stages
- With mechanical maximum pressure adjustment

Characteristics

Seat valves series D5S are designed for directional control functions. They enable individual hydraulic solutions for nominal flow up to 800 l/min due to a large variety of poppets, springs and covers, including shuttle valves, stroke limiters, solenoid valves (VV01) and position control.

A complete program is offered under the Denison brand: subplate mounted valves (D4S - chapter 6), SAE flange valves (D5S - chapter 9), pipe mounted valves (D4S - chapter 10), slip-in cartridges (CAR - on request).

Features

- Leak-free seat valve design
- 2- and 3-port bodies
- SAE61 flange
- Numerous pilot options
- 6 poppet types
- 4 sizes, SAE 3/4", 1", 1 1/4", 1 1/2"

Example pilot oil external from X1, pilot drain internal out of B

Function
 Solenoid de-energized:
 pilot oil from X1 to Z blocks the connection from A to B or B to A.
 Solenoid energized:
 pilot pressure from X1 is blocked in the VV01. The oil in Z is internally drained to port B. Allowing flow from A to B, while B to A remains blocked.

D5S with VV01 dimensions

D5S with position control

Position control by proximity switch (incl. amplifier). Valve open: proximity switch activated. This proximity switch is pressure proof and has no wearing parts.

Note: Position control for D5S08 and D5S10 only.

D5S with position control dimensions

Technical data (proximity switch)

Function		PNP, contact
Supply voltage (U _s)	[VDC]	10...30

Characteristics

**Proportional Throttle Valve
Series F5C (Denison)**

Proportional throttle valves series F5C allow to adjust the flow in proportion to the input signal. The combination of the F5C with pressure compensators R5A or R5P serves as a flow control valve - providing load compensated flow.

The F5C is offered with two types of response time:
 standard 350 ms at 1 l/min pilot flow
 code A, faster 250 ms at 2 l/min pilot flow

Features

- Spool type proportional throttle valve
- SAE61 flange
- Maximum pressure 270 bar
- Maximum flow 380 l/min
- 3 sizes, SAE 3/4", 1", 1 1/4"
- Load compensated flow in combination with R5A and R5P

Characteristics

Direct operated 2 way pressure compensators series R5A can be combined with any type of fixed or adjustable flow resistor (throttle) to provide a load compensated flow. The combination with the proportional throttle valve F5C serves as a compact 2 way flow control unit in SAE flange design. The R5A is typically used as meter-out compensator behind the flow resistor.

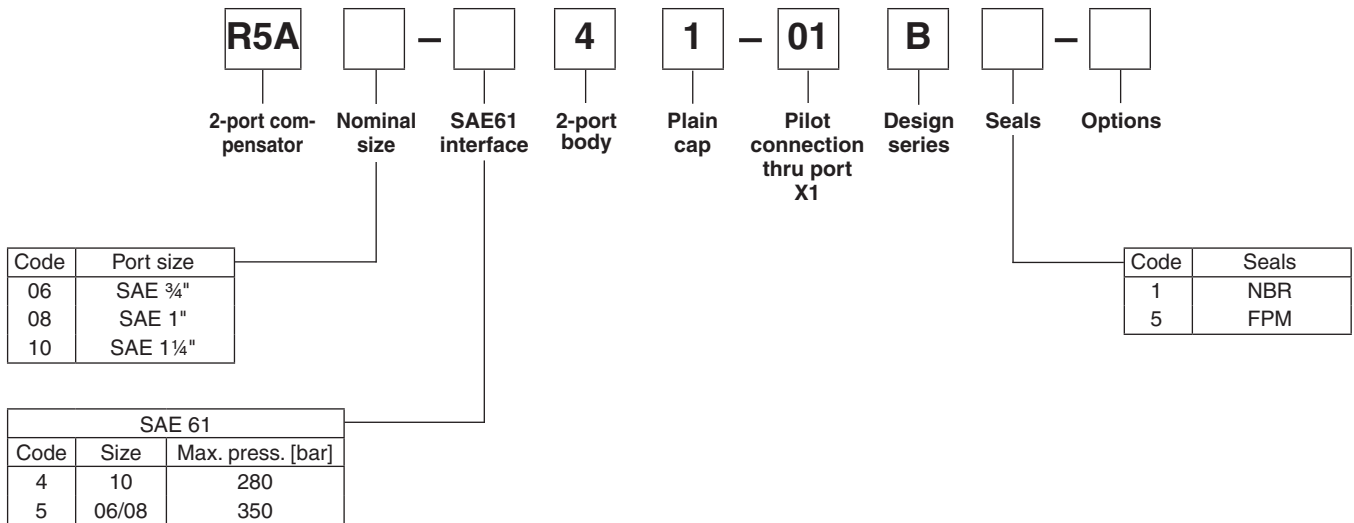

Features

- Seated type 2 way pressure compensator
- SAE61 flange
- 8.4 bar control pressure
- 3 sizes, SAE 3/4", 1", 1 1/4"
- Load compensated flow in combination with F5C

Characteristics

**3-Port Compensator
Series R5P (Denison)**

Direct operated 3 way pressure compensators series R5P can be combined with any type of fixed or adjustable flow resistor (throttle) to provide a load compensated flow. The combination with the proportional throttle valve F5C serves as a compact 3 way flow control unit in SAE flange design. The R5P is typically used as meter-in compensator in front of the flow resistor.

The R5P is additionally equipped with a pressure relief pilot, that controls the compensator cartridge and operates a system pressure relief valve. The R5P*P2 provides a proportional relief function.

Features

- Seated type 3 way pressure compensator
- SAE61 flange
- 8.4 bar control pressure
- Pressure relief function (optionally proportional)
- With optional vent function
- 3 sizes, SAE 3/4", 1", 1 1/4"
- Load compensated flow in combination with F5C

R5P*P2

Drain line only external from the pilot head (Y1.1).

The pilot drain port must be connected to a stable low pressure tank line. Pressure variations in the drain port should be avoided.

Space for plug removal

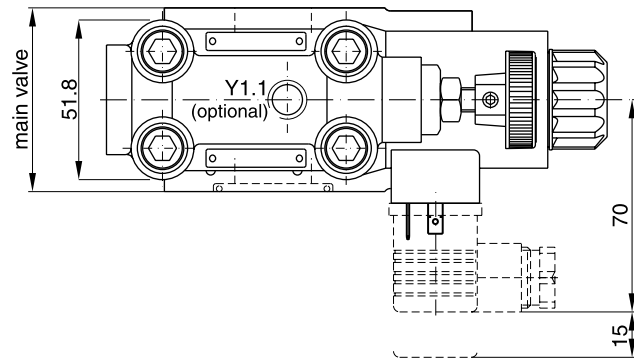

Note
On initial start up and after long shut down periods bleed air from this plug.

Characteristics

Direct operated check valves series C5V provide free flow in one direction and block the flow in the counter direction.

The SAE flanges allow to mount the C5V directly on the pressure port of pumps for protection against pressure shocks from the system.

Features

- Direct operated check valve
- SAE61 and SAE62 flange
- 4 sizes (SAE 3/4", 1", 1 1/4", 1 1/2")
- 3 springs
- 5 different seal configurations

Characteristics

**Pilot Operated Check Valve
Series C5P (Denison)**

Pilot operated check valves series C5P have a similar design to the subplate mounted C4V series. The SAE flanges allow to mount directly on the flanges of actuators to achieve a very compact design.

Features

- Pilot operated check valve
- 2-port body with SAE61 flange
- 3 sizes (SAE 3/4", 1", 1 1/4")
- 4 opening ratios

Characteristics

**Pilot Operated Pressure Relief Valve
Series R4V (Denison)**

Pilot operated pressure relief valves for in-line mounting series R4V have a similar design to the subplate mounted R4V series. For single functions - where no manifold blocks are used - the valves can be directly placed in the pipework.

The R4V valves are available with 2 ports (L-body) for in-line relief function or with 3 ports (T-body) for relief functions in the bypass.

Features

- Pilot operated with manual adjustment
- 2 interfaces
 - L-body (R4V06-G $\frac{3}{4}$ ", R4V10-G1 $\frac{1}{4}$ "")
 - T-body (R4V03-G $\frac{1}{2}$ ", R4V06-G1"")
- 3 pressure stages
- 3 adjustment modes
 - Hand knob
 - Acorn nut with lead seal
 - Key lock
- With optional vent function

Characteristics

**Pilot Operated Prop. Pressure Relief Valve
Series R4V*P2 (Denison)**

Proportional pressure relief valves series R4V*P2 are based on the mechanically adjusted series R4V. The additional proportional unit between the mechanical pilot valve and the main stage allows continuous pressure adjustment.

The optimum performance can be achieved in combination with the digital amplifier module PCD00A-400.

Features

- Pilot operated with manual adjustment
- Continuous adjustment by proportional solenoid
- 2 interfaces
 - L-body (R4V06-G $\frac{3}{4}$ ", R4V10-G1 $\frac{1}{4}$ ")
 - T-body (R4V03-G $\frac{1}{2}$ " , R4V06-G1")
- 3 pressure stages
- With mechanical maximum pressure adjustment

Characteristics

**Directional Seat Valve
Series D4S (Denison)**

Seat valves series D4S are designed for directional control functions. A large variety of poppets, springs and covers - including shuttle valves, stroke limiters, solenoid valves (VV01) and position control - allow to design individual hydraulic solutions for nominal flow up-to 600 l/min.

A complete program is offered under the Denison brand: subplate mounted valves (D4S - chapter 6), SAE flange valves (D5S - chapter 9), pipe mounted valves (D4S - chapter 10), slip-in cartridges (CAR - on request).

D4S10 L-body

Features

- Leak-free seat valve design
- 2 body designs
 - L-body (2-port)
 - T-body (3-port)
- Numerous pilot options
- 6 poppet types
- 4 port sizes
 - G 1/2", G 1" for T-body
 - G 3/4", G 1 1/4" for L-body

10

Manatrol needle valve, optional with 30° poppet, V-notch, or rectangular slot. The form of the throttle opening influences the accuracy of the flow setting, which depends on the pressure and viscosity. The needle is made of stainless steel and corresponds to a ring gap in the valve body.

$$\text{Flow rate } Q \text{ [l/min]} = K_v \cdot \sqrt{\frac{\Delta p}{\gamma}}$$

K_v from the table
 Δp [bar]

Manatrol stop and throttle valves with 2-stage needle cone. Fine adjustment for the first stage can be achieved with 3 rotations of the adjustment knob. The second stage with normal throttle characteristics is achieved with 3 further rotations. A cylindrical needle with a rectangular slot is provided to reduce the viscosity effect for sizes 200 up to 600. The flow is dependent on pressure and viscosity.

Characteristics / Ordering Code

Manatrol throttle check valves of series F with fine adjustment of the flow rate for a defined flow direction. The built-in check valve allows free flow in the counter direction with little flow resistance. A 2-stage needle provides very exact setting of smaller flow rates with the first three rotations of the adjustment knob. After 3 more rotations, the valve is completely open. The valve setting can be locked using a locking screw.

Pilot operated check valves of the series CP allow free flow in one direction (A to B).

The counter direction (B to A) is blocked. By applying pilot pressure, the poppet can be lifted from its seat against the pressure in port B. Thus flow in the counter direction is also possible. There are 1 and 2 stage poppets available with pilot ratios of 1 : 5 and 1 : 40, to suit different operating conditions.

Characteristics

Hydraulically Pilot Operated Check Valve Series RH

Pilot operated check valves series RH allow free flow in one direction (B to A). The counter flow is blocked (A to B). By applying pilot pressure the ball can be lifted from its seat and allow flow from A to B.

Most common use:

- Keeping cylinders leak-free in position, when spool type directional control valves are used
- Return line discharge, when return flow exceeds functional limits of directional control valve at differential cylinders
- As hydraulically activated drain or circulation valve

The valves are available without and with hydraulic pre-discharging.

Without pre-discharging

These valves have a ball as valve element, which quickly enables the full flow cross-section proportionally during pilot operation. A metering position in the pilot port dampens the control movement of the pilot spool so that pressure shocks (unloading shocks) are mostly suppressed.

With pre-discharging

For valves with pre-discharging a spherical polished valve spool (seat valve function) is built-in instead of a ball. The additional check valve achieves a pre-opening which provides shock-free unloading of the fluid, especially at high working pressure and large volumes.

Characteristics

**E-Module for Proportional Valves
Series PWD00A-400**

Parker electronic modules PWD00A-400 for rail mounting are compact, easy to install and provide time-saving wiring by disconnectable terminals. The digital design of the circuit results in good accuracy and optimal adaption for proportional directional control valves by a comfortable interface program.

Features

The described electronic unit combines all necessary functions for the optimal operation of proportional directional control valves without position sensor (series D*FB, D*FW, 4DP*). The most important features are:

- Digital circuit design
- Four parameterizable preset recall channels
- Constant current control
- Differential input stage
- Status output
- Four-quadrant ramp function
- Enable input for solenoid driver
- Status indicator
- Parametering by serial interface RS-232C
- Connection by disconnectable terminals
- Compatible to the relevant European EMC standards
- Comfortable interface, see Parker freeware:

ProPxD interface program

The new ProPxD software permits comfortable parameter setting for the electronic module series PCD, PWD, PZD, PID and PWDXX.

Via the clearly arranged entry mask the parameters can be displayed and modified. Storage of complete parameter sets is possible as well as print-out or record as text file for further documentation. Stored parameter sets may be loaded anytime and transmitted to the electronic module in the same manner as the basic parameters which are available for all usable valve series. Inside the electronic a nonvolatile memory stores the data with the option for recalling or modification.

Features

- Comfortable editing of all parameters
- Depiction and documentation of parameter sets
- Storage and loading of optimized parameter adjustments
- Executable with all actual Windows® operating systems from Windows® 95 upwards
- Plain communication between PC and electronic via serial interface RS-323 and null modem cable
- Comfortable interface, see Parker freeware: www.parker.com/euro_hcd → **Services** → **Downloads**

**E-Module for Proportional Valves
Series PWDXXA-40***

Parker electronic modules PWDXXA-40* for rail mounting are compact, easy to install and provide time-saving wiring by disconnectable terminals. The digital design of the circuit results in good accuracy and optimal adaption for proportional directional control valves with position sensor by a comfortable interface program.

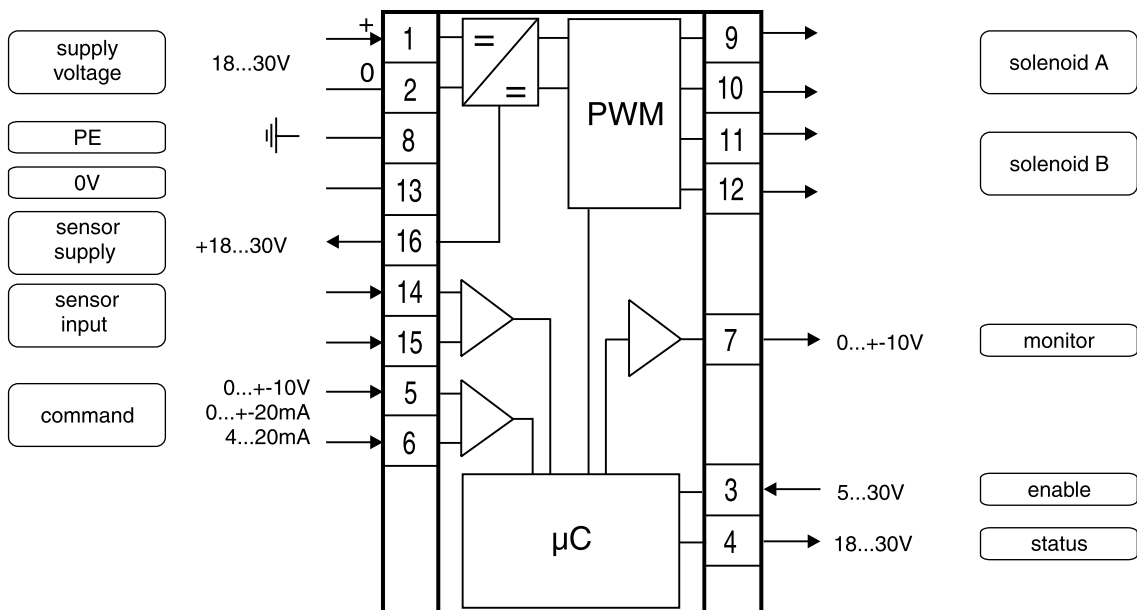

Features

The described electronic unit combines all necessary functions for the optimal operation of proportional directional control valves with position transducer or valves in closed loop systems (series D1FC, D*1FS). The most important features are:

- Digital circuit design
- Parameterizable position control of valve spool
- Constant current control
- Differential input stage with different signal options
- Monitor output for spool stroke
- Four-quadrant ramp function
- Enable input for solenoid driver
- Status indicator
- Parametering by serial interface RS-232C
- Connection by disconnectable terminals
- In combination with valves without spool feedback
 - Pressure control with proportional pressure valve and pressure sensor
 - Position control with proportional DC valve and actuator position transducer
- Optional technology function "linearization"
- Comfortable interface, see Parker freeware:

ProPxD interface program

The new ProPxD software permits comfortable parameter setting for the electronic module series PCD, PWD, PZD, PID and PWDXX.

Via the clearly arranged entry mask the parameters can be displayed and modified. Storage of complete parameter sets is possible as well as print-out or record as text file for further documentation. Stored parameter sets may be loaded anytime and transmitted to the electronic module in the same manner as the basic parameters which are available for all usable valve series. Inside the electronic a nonvolatile memory stores the data with the option for recalling or modification.

Features

- Comfortable editing of all parameters
- Depiction and documentation of parameter sets
- Storage and loading of optimized parameter adjustments
- Executable with all actual Windows® operating systems from Windows® 95 upwards
- Plain communication between PC and electronic via serial interface RS-323 and null modem cable
- Comfortable interface, see Parker freeware:
- www.parker.com/euro_hcd → **Services** → **Downloads**

11

Parker electronic modules series PCD00A-400 for rail mounting are compact, easy to install and provide time-saving wiring by disconnectable terminals. The digital design of the circuit results in good accuracy and optimal adaption for proportional pressure/flow control valves by a comfortable interface program.

Features

The described electronic unit combines all necessary functions for the optimal operation of two proportional pressure/flow control valves (series RE*W, DSAE, VB, VMY, TDA, TEA). The most important features are:

- Digital circuit design
- Two independent operable amplifiers
- Four parameterizable preset recall channels
- Constant current control
- Two input stages 0...10V
- Status output
- Two up/down ramp functions
- Enable input for solenoid driver
- Status indicator
- Parametering by serial interface RS-232C
- Connection by disconnectable terminals
- Compatible to the relevant European EMC standards
- Comfortable interface, see Parker freeware:

Characteristics

**E-Module for Command Signal Processing
Series PZD00A-40***

Parker electronic modules PZD00A-40* for rail mounting are compact, easy to install and provide time-saving wiring by disconnectable terminals. The digital design of the circuit results in good accuracy and optimal adaption for command signal processing by a comfortable interface program. The electronic unit may be connected in series to proportional valves with onboard electronic as well as to amplifier modules P*D.

Features

- Digital circuit design
- Six parameterizable preset recall channels with optional additive or priority dependent signal processing
- Output stage with different signal options
- Input stage with different signal options
- Status output
- Four-quadrant ramp function
- Reference output for potentiometer supply
- Status indicator
- Parametering by serial interface RS-232C
- Connection by disconnectable terminals
- Compatible to the relevant European EMC standards
- Optional technology function "linearization"

The Compax3F is the new member of the servo drive family of Parker Hannifin. It is especially designed for the requirements of electrohydraulic systems and in particular for position and force control of electrohydraulic axis.

Attention:
For application support and customized software, please contact your local Parker representative.

Large drive range

- Valves:
 - Proportional direction control valves
 - Proportional pressure relief- and pressure reducing valves
 - Flow valves
- Drives:
 - Cylinders
 - Rotary drives
 - Motors

Range of application

- Closed loop position and force control of linear cylinders and rotary drives
- Switching between position and force control
- Synchronous run with up to 64 axes

Typical applications

- Feeder axis
- Position and force control of press cylinders in material forming machines
- Roller clearance control in roller presses
- Die casting machines

Project development, commissioning and programming

PC Tools - open and transparent

- Compax3 ServoManager
 - Intuitively understandable user interface
 - Wizard technology
 - Online help
 - Oscilloscope function
 - Optimized co-ordination of complete mechatronic systems
- Valve and Drive manager
 - All technical data of Parker valves, cylinders and drives available
- IEC61131-3 debugging facility
- CoDeSys programming system

Additionally support through the Compax3F Hydraulics-Manager by configuration of user defined valves and drives.

Flexible service and maintenance

Operating module

- Backlit plug-in module, text display with two sixteen-character lines
- Simple menu navigation with 4 keys
 - Display of status values and
 - clear text error messages
- Used for changing parameters and manual operation

Jerk-limited set point generation, resulting in

- Gentle handling of the items being moved
- Increased service life of mechanical components
- Overshoot-free positioning
- Reduced excitation of mechanical resonance frequencies

Control

- 2 control loops for each axis for combined position and force/pressure control

Position control

- Automatic controller design
 - User-oriented optimization of parameters
 - Robust controller setting
- Feed forward control of speed and acceleration which results in:
 - Optimization of the response behaviour
 - Minimization of the following error

Force/Pressure controller

- PID controller with feed forward control of speed

2-axis synchronous run

- 2 operation modes:
 - Master slave
 - Average of actual value

Hydraulic specific functions

- Realization of many different circuit concepts with up to 4 proportional valves possible
- Linearization functions:
 - Consideration of the area of differential cylinders
 - Inverting of the valve set value
 - Compensation of the load pressure (additional pressure sensors necessary)
 - Correction of the nonlinear flow characteristic of the valve
 - Overlap compensation
 - Valve zero point correction
 - Valve set value filters
 - Valve set value limitation
 - For each valve individually available
 - Automatic configuration by component selection in the Compax3 ServoManager
- Hydraulic corner power limitation
 - Limitation of the maximum hydraulic power consumption, intelligent energy management

Set up controller optimization

- Compax3F HydraulicsManager
 - All necessary technical data of Parker valves and drives are available
- Test movement for automatic controller attitude
- Optimization with integrated oscilloscope function

11

Real-time signal processing

- Oversampling of the speed and current signals which result in:
 - Reduction of the quantization noise
 - Increase in signal resolution
- Online feedback error compensation corrects for offset and gain errors
- 14 bits increase in resolution
 - By interpolation of sine-cosine feedback signals

Interface

Field bus

- Profibus DP
- CANopen (CiADS402)
- DeviceNet
- PowerLink
- Address configurable via Dip switch

Connection of external inputs/outputs

Parker I/O - System (PIO)

Additional external digital and analog inputs and outputs can be integrated via the CANopen.

Integration with the Office environment

ActiveX plug-in

- Office and industrial environments are constantly growing closer together.
- The use of ActiveX technology allows simple integration into Office application.

Monitoring and control

Operator Panels

Control equipment for all text and graphics applications in industrial environments using Profibus DP, CANopen, DeviceNET and Interbus-S field busses. From two-line displays to touch-panels. For further information please refer to catalogue 192-081011.

In addition to drivers for Compax3/Compax3 powerPLmC, drivers for other PLC products can be integrated on request.

International standards in programming

Advantages offered by integrated standards

- Programming system
 - CoDeSys
- Programming language
 - IEC61131-3
 - Function modules based on PLCopen

Compax3 T30 Motion control according to PLCopen**Function range T30****General**

Due to its high flexibility and efficiency the Compax3 motion control according to PLCopen is for most applications the optimal basis for decentralized motion control.

Positioning with function modules based on PLCopen

- Programmable based on IEC61131-3
- Programming system: CoDeSys
- Up to 5000 instructions
- 500 16-bit variables / 150 32-bit variables
- Recipe table with 288 variables
- 3 16-bit saved variables (power failure protected) / 3 32-bit saved variables (power failure protected)
- PLCopen-function modules:
 - Positioning: absolute, relative, additive and continuous
 - Machine Zero.
 - Stop, energizing the power stage, quit
 - Position, device status, reading axis error
 - Electronic gearbox (Mc_GearIn)
- IEC61131-3-standard modules:
 - Up to 8 timers (TON, TOF, TP)
 - Trigger (R_TRIG, F_TRIG)
 - Flip-flops (RS, SR)
 - Counters (CTU, CTD, CTUD)
- Device-specific function modules:
 - C3_Input: generates an input process image
 - C3_Output: generates an output process image
 - C3_ReadArray: access to recipe table
- Inputs/outputs:
 - 8 digital inputs (24V level)
 - 4 digital outputs (24V level)
 - 6 analog inputs (14 bits)
 - 4 analog outputs (16 bits)
 - Optional addition of 12 digital inputs/outputs

PLCopen function blocks

- Absolute positioning
- Relative positioning
- Additive positioning
- Continuous positioning
- Stop
- Machine zero
- Energizing the power output stage
- Reading device status
- Reading axis error
- Acknowledging errors
- Reading the current position
- Electronic gearbox (gearing)

Additional function range

- Absolute force control
- Combined position and force control
- Control mode switching between position and force/pressure control
- 2-axis-synchronous-run

Absolute/Relative positioning MoveAbs und MoveRel

One motion set defines a complete motion profile with the parameters:

- 1: Target position
- 2: Velocity
- 3: Maximum acceleration
- 4: Maximum deceleration
- 5: Maximum jerk

Stop motion Stop

The Stop set interrupts the current motion set.

Mark-related positioning: RegSearch, RegMove

For mark-related positioning, two operating modes are available:

- RegSearch: Search for an external signal e.g. a registration mark on a product.
- RegMove: The external signal interrupts the search move and the second move follows without interruption
- Precision of the registration mark detection: <math>< 1\mu\text{s}</math>

Electronic gearbox Gearing

Motion synchronized to a master axis with any transmission ratio. The position of the master axis can be detected via:

- +/-10V analog input
- Step/direction command input
- The encoder input or HEDA bus, using a Compax3 master.

Dynamic positioning

A new motion profile can be selected during a positioning sequence – a smooth transition takes place.

Example of an field bus interface controlled IEC61131-application

- 2 control words are placed on the cyclic channel of the bus.
- The position data records (position, speed, acceleration etc.) are stored in a table (array).
- The desired position data record is selected with Controlword_2.
- The individual bits of Controlword_1 control positioning.
- A return message is sent via a status word on the cyclic channel of the bus.

Example of a bus interface controlled IEC61131 application

Compax3 T40 IEC61131-3 positioning with cam function modules

T40 function range

General

Compax3 T40 is able to simulate mechanical cams and cam switching mechanisms electronically. The T40 electronic cam was especially optimized for:

- The packaging machine industry
- For the printing industry
- All applications, where a mechanical cam is to be replaced by a flexible, cyclic electronic solution

This helps to solve discontinuous material supply, flying-knife and similar drive applications using distributed drive technology.

Compax3 T40 supports both real and virtual master movements. In addition, the user can switch to other cam profiles or cam segments, on the fly.

Programming is carried out in the well-known IEC61131-3 environment.

With the aid of the cam function modules and CamDesigner, cam applications can be implemented very easily.

Function T40

- Technology functions of the T30 version fully integrated and available
- Master position acquisition
- Mark synchronization
- Cam switching mechanism
- Coupling and decoupling function
- Cam profiles
- Cam memory
- Cam creation with CamDesigner

Master position acquisition

- Acquisition by incremental encoder
- Acquisition by the HEDA real-time bus
- Virtual Master:

A second axis in the IEC program can be used to program a motion profile, which serves as a master for one or several axes.

Mark synchronization

- Master or slave oriented (simultaneous, cam-independent)
- Highly-precise mark recognition (accuracy <math><1\mu\text{s}</math>; Touchprobe)

Cam switching mechanism

- 36 cams with individual profiles
- 4 fast cams (125 μs per cam) standard: 500 μs
- 32 serial cams, 16ms/cam cycle (0.5ms/cam)
- Delay-time compensated cams: Compax3 can advance the cam to compensate for delays in switching elements.

Coupling and decoupling functions

- By means of a set point generator
- By means of a change-over function
- Without overspeeding by coupling over several master cycles
- Virtually free set-up of the coupling and decoupling movement
- Master-guided coupling movement
- Random standstill position

Cam profiles

- Up to 20 cam segments can be produced by:
- Virtually random cam links (forwards and backwards)
- Freely programmable event-controlled cam branches
- Scalable cam segments and complete cam profiles

Cam memory

- 10,000 points (Master/Slave) in 24-bit format
- High-precision profile generation:
 - Variable point spacing with full backup of the current master and slave coordinates (even if the power fails)
 - Linear interpolation between points
- Cam memory for up to 20 curves

11

Connection of high-level controllers

Control via digital inputs/outputs Compax3 I11T30 / I11T40

The digital I/Os can be optionally extended by 12 I/Os (M10 and M12 option).

**Control via Profibus, Compax3 I20T30 / I20T40
Profibus-ratings**

DP-Versions	DPV0 / DPV1
Baud rate [MBit/s]	up to 12
Profibus ID	C320

**Control via CANopen, Compax3 I21T30 / I21T40
CANopen-ratings**

Baud rate [kBit/s]	20, 50, 100, 125, 250, 500, 800, 1000
Service-Data-Object	SDO1
Process-Data-Objects	PDO1, ... PDO4

Control via DeviceNet, Compax3 I22T30 / I22T40

DeviceNet ratings	
I/O - data	up to 32 bytes
Baud rate [kBit/s]	125...500
Nodes	up to 63 Slaves

**Control via Ethernet Powerlink,
Compax3 I30T30 / I30T40**

Ethernet Powerlink ratings	
Baud rate	100Mbits (FastEthernet)
Cycle time	<200µs; to 240 nodes

**Decentralized control via CANopen, I21T30 / I21T40
With external inputs/outputs (PIO)**

Additional external digital and analog inputs and outputs can be integrated via the CANopen master function. For this purpose we offer the Parker I/O system (PIO):

- CANopen field bus coupler: 650mA/5V, 1650mA/5V
- Digital input terminals: 2-, 4-, and 8-channel
- Analog input terminals: 2-channel (0-10V), 4-channel (0-20mA)
- Digital output terminals: 2-, 4-, and 8-channel
- Analog output terminals: 2-channel (0-10V, 0-20mA, +/-10V)

Software Tools

Simple, wizard-guided configuration and commissioning Compax3 ServoManager

Software Tool C3 ServoManager

Configuration is carried out on a PC using the Compax3 ServoManager.

- Wizard-guided configuration
 - Automatic querying of all necessary entries
 - Graphically supported selection
- Setup mode
 - Moving individual axes
 - Predefined profiles
 - Convenient operation
 - Storage of defined profiles
- Integrated 4-channel oscilloscope
 - Signal tracing directly on the PC
 - Various modes (single/normal/auto/roll)
 - Zoom function
 - Export as image or table (for example to Excel)

C3 ServoManager with oscilloscope

Software Tool HydraulicsManager

- Simple set up of customer valves, cylinders and drives.
- Technical data of all Parker valves, cylinders and drives available.

C3 HydraulicsManager valve database

Servo Drive Series Compax3F

Cam creation with CamDesigner Software Tool CamDesigner

- Standardized Nolte cam generating tool with:
 - Standard or extended range of functions
 - Evaluation of the motion profiles
 - Verification of the drive sizing
- Transition laws from VDI directive 2143:
 - Selection of motion laws
 - The CamDesigner basic version features 15 motion laws (based on the dwell-to-dwell (interpolation method))

Evaluation of the motion profile

Cam generation with the integrated CamEditor

Advantages offered by international standards in programming

IEC61131-3 Programming language

IEC61131-3 is the only company- and product-independent programming language with worldwide support for industrial automation devices.

- IEC61131-3 includes graphical and textual programming languages:
 - Instruction list
 - Structured text
 - Ladder diagram
 - Sequential function chart
 - Function block diagram

11

- Integrated standards offer:
 - A trusted programming environment
 - Standardized programming
- Integrated standards reduce:
 - The overhead of development
 - Maintenance costs
 - Software upkeep
 - Training overhead
- Integrated standards increase:
 - Productivity
 - Software quality
 - Concentration on core competence

Function plan

Function modules based on PLCopen

PLCopen is a product- and company independent organization that plays a significant role in supporting the IEC61131-3 programming language. Its specific tasks also include defining basic processes relevant to motion. The PLCopen organization consists of both users and manufacturers of automation components.

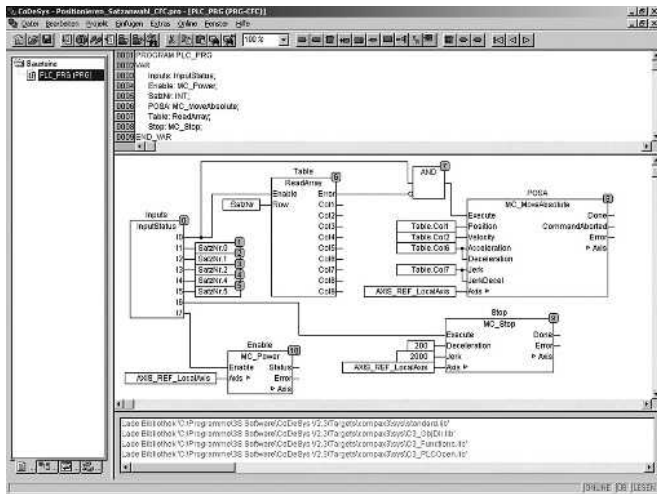

Parker Hannifin is an active member of the "Motion Control" task force. This is a great advantage for the users of Parker drive technology, since they are constantly able to profit directly from the latest developments in PLCopen.

Professional development tool CoDeSys

CoDeSys is a development environment for programming that saves a significant amount of time as applications are created.

- One of the most powerful development environments available, established world-wide
- Universal programming platform for various devices
- Visual elements
- Library management for user-defined applications
- Context-sensitive help wizard
- Data exchange between devices from different manufacturers
- Complete online functionality
- Sophisticated technological features
- ... and all this for no additional cost

Program development in CFC

Project management

Saving an entire project (source file) including symbols and comments to make service calls easier, because there is no need for any project data on the device itself

- Archiving projects as ZIP files
- Creating user-specific libraries that can be reused as tested sections of programs
 - These libraries can be protected
 - Examples include winders, synchronization components etc.
- Various user levels make it possible to lock sections of the program with passwords
- Depending on the task at hand, users can select from among 5 IEC languages plus CFC. These languages can also be mixed

Parker is a member of the “CoDeSys Automation Alliance”.

Dimensions

Connection set ZBH02/04

Complete kit with mating plug connectors (X1, X2 and X3) for Compax3 connectors and special shield connecting terminal

Feedback cable GBK../..

- Connection to the Motor:
- Under the designation "REK.. + GBK.." (Feedback cable) we can deliver feedback connecting cables in various lengths to order.
- Prefabricated with plug and cable eye
 - The plugs of the Parker motor and feedback cables contain a special surface area screening.
 - Cable plans, if you wish to make up your own cables

Terminal block EAM06../..

- For additional wiring of the inputs and outputs:
- Available with or without LED display
- Can be mounted in the control cabinet on a supporting rail
- Connection EAM06../.. via SSK23../..to X11, SSK24../..to X12

Accessories

**Servo Drive
Series Compax3F**

RS232 cable SSK01/..

(in various lengths).

Configuration:

Via a PC with the aid of the Compax3 ServoManager.

Communication:

Communication with Compax3 either via RS232 or via RS485 in order to read or write into objects.

HEDA Bus

- HEDA bus terminal connector (RJ45) BUS07/01:
- For the first and last Compax3 in the HEDA bus.
- HEDA cable: SSK28/.. prefabricated in various lengths:
- Cable for HEDA bus wiring from Compax3-to-Compax3 or PC-to-Compax3 powerPLmC.

Profibus plug BUS08/01

- BUS08/01 with 2 cable inputs (1x BUS08/01 incoming, 1x BUS08/01 continuing) and screw terminals, as well as a switch for activating the terminating resistor. Set to ON for first and last bus node terminating resistor activated.
- **Profibus cable: SSL01/.. not prefabricated**
- Special cable in any length for Profibus wiring (colors according to DESINA).

CANbus plug BUS10/01

- BUS10/01 with 2 cable inputs (1x BUS10/01 incoming, 1x BUS10/01 continuing) and screw terminals, as well as a switch for activating the terminating resistor. Set to ON for first and last bus node terminating resistor activated

CANbus cable SSL02/.. not prefabricated

- Special cable in any length for CANbus wiring (colours according to DESINA)

Operating module BDM01/01

- For display and diagnosis purposes:
- Can be plugged in during operation
- Power supply via Compax3 servo control
- For displaying and changing values

External Inputs/Outputs PIO...

For Compax3 I21 from technology function T30 onwards via CANopen:

- Integration of additional external input and output modules (digital and analog)

Single-phase power units providing direct current are preferable and suitable for the power supply to electronic modules and proportional valves. The windings of these transformers are separated for safety and provided with isolated screened windings with earthing.

Features

- Safety transformer to EN 60742 with integrated fuse
- Primary and secondary windings fitted with shielded windings with earth connection
- Optimal voltage accommodation with ±10V tappings
- Low ripple of 5% at full load
- Integrated LED operational indicator of output voltage

Characteristics

Nominal input voltage	[VAC]	110/230
Regulation/Tappings at	[V]	+/-10
Frequency	[Hz]	50/60
Operating temperature	[°C]	-20 to +60
Nominal output voltage	[VDC]	24
Output voltage at zero load	[VDC]	30.5
Output voltage at full load	[VDC]	22.4
Ripple	[%]	below 5
Protection		IP 00
Construction		VBG 4
Regulations / Test voltages		EN 60742

EX00-N08	120	113	173	90	94.5	5.8	6.3

Note

To guarantee air convection the module has to be mounted in a hanging position.

The test unit EX00-M03 is suitable for the control of proportional valves incorporating integrated electronics. It provides commissioning and function tests independently of the machine control system. The test unit is provided with all necessary signal and measurement taps, making it possible to proceed initial operation and diagnosis.

Features

- Control of valves incorporating integrated electronics and central plug acc. DIN 43563 (6p.+PE)*
- Mains connection selectable 230/115VAC
- Built-in fuses
- Cord set included
- Integrated digital voltmeter with
- test point selector switch
- Test jacks
- Rugged metal enclosure with handles

* not usable for D*FP valve series

Multi-station manifolds are used to save space when connecting several directional control valves to a common pressure and return line.

Diverse switching arrangements are possible in combination with sandwich and directional control valves. Plugs without designations must not be removed.

Features

- Very low pressure drop due to large drilling parameters
- P- and T-ports on both faces
- Also available with gauge ports G¼
- Separation in P or T channel optional - please consult your distributor

Technical data

Interface	DIN 24340, Form A, CETOP, ISO
Mounting position	unrestricted (valve axis preferably horizontal)
Working pressure	[bar] max. 350

Characteristics

Cartridge manifold blocks are bodies for 2/2-way slip-in cartridge valves. They are used in systems with only one cartridge valve without the need to design a specific manifold block.

The pilot ports X and Y can either be connected to A and B or vice versa by changing the mounting position of the cartridge cover.

The wide range of Parker slip-in cartridge valves allows to design solutions for all hydraulic requirements.

Features

- Flanges SAE61 or SAE62 respectively CETOP square flange
- 2 options for pilot oil supply and drain
- 7 sizes

Technical data

Mounting interface	ISO 7368-B*-2-A/B
Mounting position	unrestricted ¹⁾
Max. operating pressure	[bar] 138 to 350 (depending on p _{max} of flanges)
Flanges	SAE61 (3000 PSI series), SAE62 (6000 PSI series) ISO 6162, CETOP-square flange (400 bar series)

¹⁾ Cartridge manifold blocks are usable for all cartridge covers except C*A, C*B, C1DB and C10D.

Characteristics / Ordering Code

By using the pressure gauge selector valve in hydraulic systems, up to 5 or 10 measuring points can be connected to one pressure gauge. When measuring is completed, the gauge is pressure-relieved to prevent it from being damaged by pressure surges. The accuracy and life of the pressure gauge are thus increased considerably.

Design

Pressure gauge selector valve with locking, pressure-relieving piston. Measuring point selection by marked rotary handle and graduated dial.

Function

To select one of the measuring points from 1 to 5 or 1 to 10, the rotary handle is pulled out fully, and turned to the left or right. When the measuring point is selected by means of the handle marking and the dial, the handle is pushed in and the pressure gauge loaded with the pressure present. The piston is locked in the measuring position by a catch. When measuring is completed, the handle is pulled out, to relieve the pressure gauge via the drain line.

Features

- 5 or 10 measuring positions optional
- Extends the service life of the manometer by unloading the pressure.

Technical data

Characteristics

The electro-hydraulic pressure switch provides an electric signal when the sensed pressure goes above or below the selected setting.

Function

The spring loaded piston is hydraulically damped. The PSB provides a very accurate hysteresis between the switching points (see diagram).

The required operating pressure is adjusted by the set-screw. Unauthorised adjustments can be prevented by the optional cylinder lock. The electric element is a micro switch with snap-action contact. Three terminals permit application as "On", "Off" or "Changeover" switch.

The electrical connection is made with a 3-pole plug-in connector to EN 175301-803 with ground.

Note

For inductive DC loads a spark discharger should be used to increase service life.

Features

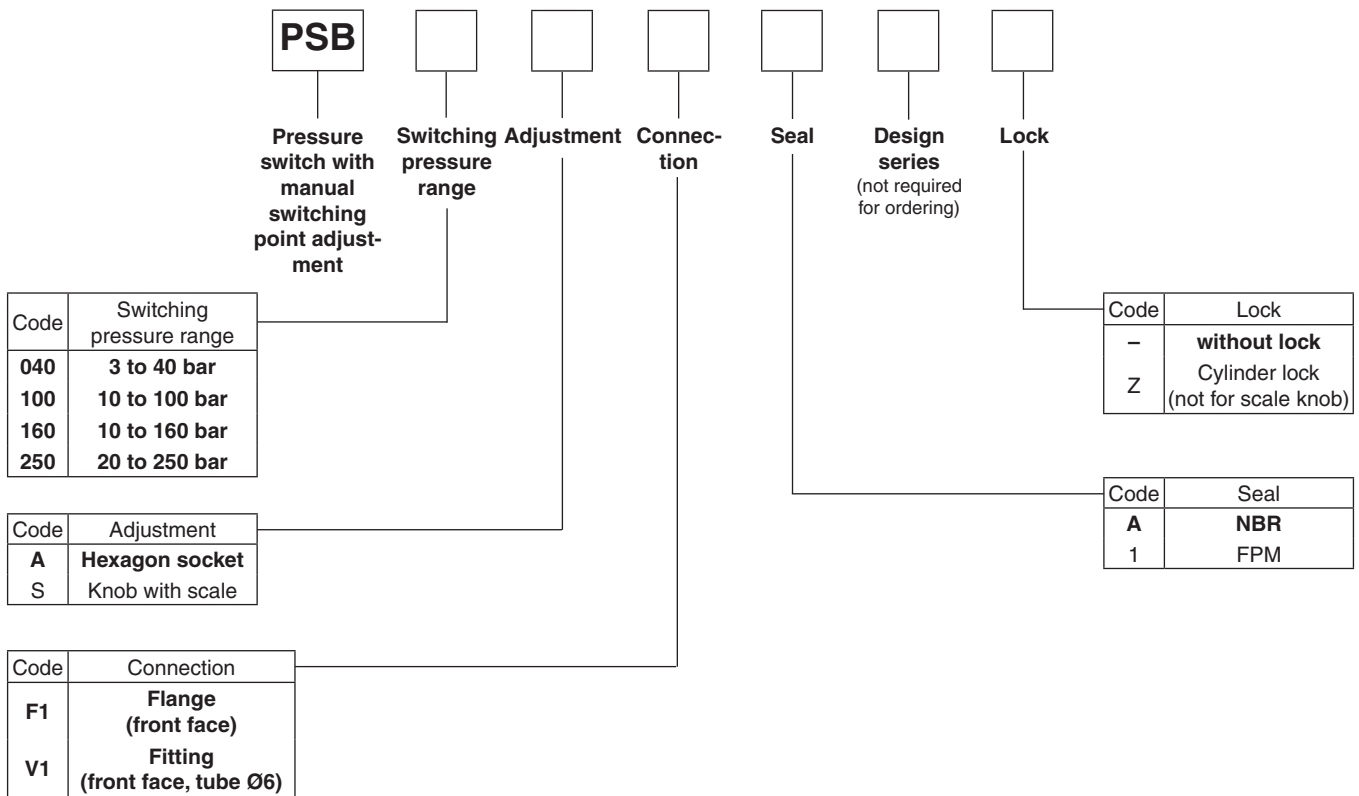

- Flange or pipe mounting
- 4 pressure ranges
- Can be used as opener or closer
- Cylinder lock optional

Characteristics

- Compact
- Rugged
- Reliable
- Easy operation
- Long-term stability
- Excellent interference resistance
- Metal housing
- High protection class
- Many variants
- Rotatable
- Analogue output
- Password
- MPa, bar, psi

Electronic Pressure Switch Series SCPSD

The Pressure Controller combines the functions of a pressure switch, a pressure sensor and a display instrument:

- Pressure display (manometer)
- Switching outputs
- Analogue signal

Simple operation, compact design and high reliability are the most important features of the SCPSD. The Pressure Controller offers excellent technical performance and optimum pressure management. It is ideal for permanent use in industrial applications.

Easy to operate

Parameter setting is carried out via the keys or with a programming module.

High functionality

Every switching output can be set individually:

- Normally closed/normally open contacts
- On and off switching pressures
- Delay times
- Hysteresis/window function
- Damping

Intelligent settings which are not possible with a mechanical switch can be achieved with these convenient switch functions. Several switches can be replaced by a single controller.

The analogue output is individually settable

- 0/4...20 mA switchable
- Settable initial pressure
- Settable final pressure

Reliable/safe

Pressure is captured by a measuring cell with long-term stability. Any functional error is monitored and can be processed in accordance with DESINA. Thanks to a password, unauthorised change of parameters is prevented.

Rugged

The housing is made of metal and is resistant to humidity, shock and vibrations. The electronics are protected from reverse polarity, overvoltage and short circuits.

Everything within view

The large illuminated display is readable even from a considerable distance. Pressures are shown in MPa, bar or psi.

Optimum installation possibilities

With its compact design and excellent interference resistance the SCPSD is suitable for installation under critical conditions.

With its directionally settable housing, the display can always be read very easily.

Universal

Many versions are available to suit a wide variety of applications.

- Optical interface
- Switch status display

Everything in view

- Chamfered display
- Digital display
- Large
- Luminescent
- Display
- psi/bar/Mpa
- Actual pressure
- Minimum pressure
- Maximum pressure
- Switching points

Easy to operate

- 3 large keys
- Display of units

Pressure connection

- Stainless steel
- Measuring cell stable long-term
- Wide media tolerance

Rugged

- Metal housing
- Watertight
- High interference resistance
- Vibration resistant
- Shockproof

Flexible installation

- Compact
- Rotatable 290°

Thread

- Internal thread
- External thread

Tube clamp

- Safe mounting with a rugged SCSD-S27 clamp

Programming module

- Can be set with ControllerWIN software

12

Pressure range selection

With pressure switches the settable pressure is very relevant.

Because a 400 bar pressure switch shows the same resolution (1 bar) as a 600 bar pressure switch (also 1 bar), a 600 bar pressure switch can be deployed even at a smaller nominal pressure (eg. 315 bar).

The positive effects of this are the same accuracy with higher safety and fewer product variants.

Accessories
Clamp

Characteristics

Pressure Intensifier Series SD500

Pressure intensifiers are used wherever a particular section of a hydraulic system has to be pressurised to a substantially higher pressure than the available primary pressure allows (clamping functions). With an intensification ratio of 1 : 4 (1 : 2, 1 : 6) it enables a cost-effective system solution especially in clamping applications, with primary pressures up to 125 bar. A pilot operated check valve can be flanged underneath the pressure intensifier for quick filling and decompression of the high pressure section.

Design

Main functional parts of the pressure intensifier: piston, rocker mechanism, slide valve with lock, 4 check valves which separate the high pressure section from the low pressure section, check valve in the tank port to partition of the tank section from the primary pressure.

Features

- Mounting pattern NG6, DIN 24 340 Design A, CETOP, ISO
- Check valve attachable to bottom flange
- High pressure up to 500 bar
- Volume flow formed with low pulsation
- Compact design

Function

After the high pressure section is filled with oil, (e.g. extension of a clamping cylinder), the pressure intensifier begins operation: The low pressure moves the intensifier piston because of the surface ratio and compresses the oil column in the high pressure section.

At the end of the intensifier's piston stroke, the rocker mechanism switches the directional slide valve to the crossed switching position, and the intensifier piston pumps oil from the piston rod area into the high pressure section. The process repeats itself until the pressure ratio corresponding to the surface ratio has led to a balance of force on the intensifier piston.

The pressure intensifier switches itself off and immediately on again when the high pressure (e.g. due to external leakage) begins to drop (pay attention to the flow characteristic). The switching speed of the slide valve is dependent on the operating speed of the intensifier piston.

Note

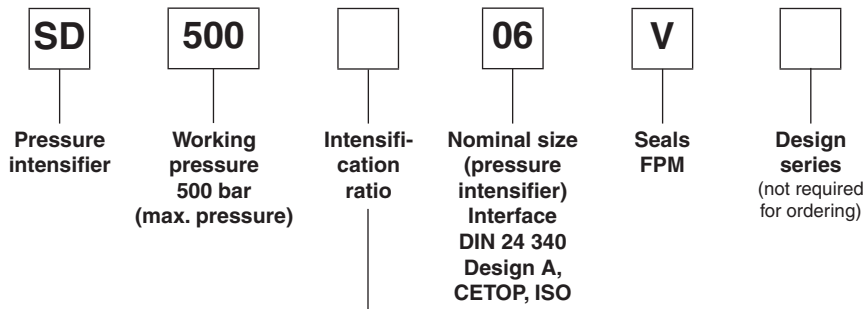

- To avoid exceeding the admissible maximum pressure, a pressure relief or pressure control valve must be fitted on the primary side (pressure setting, max. 125 bar / 1 : 4, max. 250 bar / 1 : 2 or max. 83 bar / 1 : 6).
- There must be no pressure peak on the primary side when operating in the maximum pressure range.
- It is recommended to mount a 10µm filter on the primary side to ensure damage-free operation.

Description	Page
Starting up hydraulic systems	13- 3
Hydraulic fluids	13-11
Terms and conditions	13-18
Company portfolio	

A hydraulic system that operates economically, safely, and trouble-free requires careful planning, as well as proper installation and start-up. Conscientious maintenance has a considerable effect on the service life of the hydraulic elements.

The following methods are to be observed when starting up and performing maintenance. There are helpful tips for fault correction in the trouble-shooting section.

The information given in these instructions are of a general nature and require other professional procedures. The commissioning of the hydraulic equipment must be in accordance with the putting into operation of the entire machine or installation and shall be done by experts who have the special hydraulic knowledge. For a safe and successful start-up, the information for installation and commissioning of each component particularly must be observed.

Technical safety instructions

The hydraulic system is to be planned and executed so that personnel cannot be endangered during possible malfunctions. This requires that the diverse pumps and devices are operated within their specified operating pressure ranges. Possible damage to the system and the electrical control system must be limited to a minimum.

Welding performed afterwards on oil reservoir may only be carried out by specialists at their own risk. Remaining oil and the cleaning cover must be removed.

Preventive steps must be introduced to avoid danger through the welding work.

Further measures must be arranged, depending on where the hydraulic system is set up, such as whether an oil receiver must be provided in water protection areas, etc. Or whether hardly inflammable liquids must be used with an increased fire hazard.

Hydraulic accumulator

For putting in operation and using accumulators the national rules, guidelines and regulations must be observed.

Hydraulic accumulators must be pre-charged only with nitrogen. Therefore the filling up of the accumulator must be done according to the instructions of the producer by using only the special tools.

The testing documents of the hydraulic accumulators and safety valves must be stored separately. If necessary, they must be presented to the safety commissioner. It's not allowed to remove the lead seal of the safety valves. Observe information signs.

Transport

The power unit or the completely mounted manifold was properly packed and handed over to the transport company. If there are damages, please contact the manufacturer or your transport company.

For further transportation the hydraulic must be handled with care.

Storage

The power unit, manifolds and components must be protected from contamination, and from mechanical and weather damage.

Suitable measures must be taken to prevent corrosion if they are stored for longer periods of time without final painting.

Mounting

The pipe connection joints of the unit must be connected with the externally mounted devices and manifolds or the machine according to the positions shown in the hydraulic scheme.

Particularly the following points are to be observed:

- Use cold-drawn precision steel pipes, with the exception of nominal widths bigger than or equal NW50.
- Observe pipe cross-sections and permissible working pressure.
- Remove plastic plugs immediately before beginning pipeline work.
- Assemble pipe bends using bending devices.
- The pipe cross-section may not be pinched when bending.
- The pipes, after being cut to their exact lengths, are to be thoroughly debarred and cleaned.
- Fittings corresponding to pressure and environmental conditions are to be used on the system, and the manufacturer's assembly instructions followed.
- Pipelines are to be laid and tightened without stress.
- Heat-treated pipes must be mechanically cleaned and descaled.
- Drain lines are not to be crimped, and if possible, at a falling angle to the tank, above the oil level.
- If hose lines must be used, they must be selected according to the pressure and the environmental conditions of the system. Note their stability, working pressure, and nominal width.
- The pipes must be sufficiently mounted with pipe brackets to avoid vibrations.
- It is advisable to provide venting connections at the highest position in the pipeline network.
- The power units, the manifolds and the connected parts of the system must be installed and mounted safely for operation.

Fluids

In order to facilitate the selection of suitable fluids, we refer to the following chapter. This contains information about appropriate oil types. The fluids must meet the requirements of DIN 51524 sections 1 and 2.

Separate instructions must be observed for other fluids (e.g. compatibility with sealing materials).

Commissioning

Start-up may only be carried out by specialists. Particularly the special instructions of the manufacturer and the producer of the components must be observed.

The hydraulic scheme, the parts list, and the control system flow chart should be present. The planned pressure setting must be indicated for all pressure valves in the hydraulic scheme.

Starting-up safety instructions

Before start-up the assembly of the complete hydraulic equipment must be inspected by specialists. Particularly the following points are to be observed:

- Mounting of pipes including clamping
- Accurate connection of pressure and return pipes
- Accurate connection of the pilot pressure pipes
- Accurate assembly of the hydraulic components
- Accurate connection of the power unit
- Accurate connection of the manifolds
- Accurate connection of the cylinder and hydraulic motors
- Accurate connection of the electrics
- Hydraulic equipment must be mounted safely for the operation.
- Parts of the entire system where driven by the hydraulics must be mounted safely for the operation.

Before start-up of the hydraulic system the specialists must prepare all necessary requirements to protect individuals and parts of the system against damage.

The start-up must be done very carefully according to the safety regulation.

Filling

Before the hydraulic fluid is poured into the tank, its interior must be checked again for cleanliness, and be cleaned if necessary.

The tank is to be filled using a fine filter, so that the desired cleanliness class of the fluid is ensured when starting up. Special filling units or equipment provided with the system are especially suitable for this, e.g. the return line filter.

The oil type is indicated on a separate sign next to the filling opening.

Flushing

After filling the reservoir with fluid we recommend the flushing of the fluid inside the hydraulic system where the fluid flushes around many times in the reservoir.

Before starting the flushing the servo-valves and proportional-valves must be removed and replaced by flushing plates to avoid damages of these valves according contamination. Start-up of the components and the function of the entire system should only begin once the required minimum cleanliness and the operating temperature are reached.

It is recommended to flush the long pipelines by short circuiting the pressure and return lines, especially for large, central pressure oil stations. This prevents the installation dirt from entering the pilot valves (especially important for servo and proportional valves) or the drives (cylinder, hydro-motors, etc.). The diverse measures should be coordinated during design.

Electrical connections

Are the correct current and voltage types available?

- Motor
Check available current with the E-motor type plate.
- Solenoids
Are the type of current (~ or =) and the voltage correct? Check the labels of these devices.
- Plugs
The electronic connections must be done according to the technical rules by using the appropriate plugs.
- Grounding
Power units, parts of the system and single mounted components must be grounded.

Pumps and devices

The pump case must be filled with the clean operating hydraulic fluid before start-up to lubricate the bearing with oil.

Particularly the special start-up instructions for pumps and hydraulic and electric devices must be observed.

The following section contains only the most important aspects.

- Pumps

It is advantageous to keep the pressure setting low at first when starting the pump for the first time. The pressure compensator for variable displacement pumps and the pressure limiting valve for fixed displacement pumps are set to approx. 15 - 20 bar.

- Pressure valves

Depending on the machine function, first begin with a minimum pressure setting. Enter pressure onto the measuring location plate after the final pressure is established.

An exception are the design-tested and preset accumulator safety valves.

- Pressure unloading valves

For setting the pressure unloading valves according the pressure information in hydraulic schematic particularly the start-up instructions for this valve must be observed.

- Throttle valves

Set every drive (cylinder etc.) in steps via the throttle or flow control valves at the desired speed or stroke time.

- Directional valves

Select the direction using the electric control system for electrically operated valves.

Manual override of the solenoid requires a suitable tool.

- Proportional valves

Proportional pressure flow and DC valves must be first started with a low electrical command signal.

- Hydraulic accumulators

If hydraulic accumulators are assembled into the system, these must be verified at and/or filled up to the correct gas pre-load level. Suitable testing and filling equipment is necessary.

Hydraulic accumulators may only be filled with nitrogen for reasons of safety. The pre-loading coordinated with the working pressure is indicated in the hydraulic scheme.

In general, the following applies:

Gas pre-loading = min. working pressure x 0.9

After testing or filling, the hydro-storage can be switched into the system via ball valve.

Switch on

First the motor is quickly switched on and directly switched off to determine the rotation direction. The correct rotation direction is indicated by an arrow on the pump housing. If the rotation direction is incorrect, reverse the polarity of the e-motor. The pump is started by multiple short start-ups (on-off operation). After approx. 1 min run time, the working pressure can be set to its nominal value (see also 'Trouble-shooting' 1.1 and 1.2).

Start-up information provided by the pump manufacturer has higher priority than these instructions.

Air bleeding

Air in the hydraulic system is very disadvantageous and undesirable for the control system. The system must be carefully vented, especially for the first start-up, for oil changes, or when lines and valves were opened. All functions are run through, one after the other, in no-load operation with low pressure and with full cylinder stroke.

The pipeline network is vented at its highest point. The fitting can be loosened a little so that the air can escape with only a small amount of oil escaping. When the oil is no longer foaming, the fitting is retightened.

If the air bleeding cylinder is provided with venting screws, these should be used for venting. It must be noted, however, that the full cylinder stroke must be travelled several times. These venting screws must be at the top for horizontally arranged cylinders.

After filling the cylinder, the oil level in the tank must be checked, and refilled as necessary.

Filter

The function and service life of pumps and hydro-devices are strongly affected by the cleanliness of the fluid. Dirt is the greatest enemy of hydraulic systems. There are three important sources of dirt to watch out for:

- Contamination arising during installation, installation dirt
- Contamination arising during operation, operation dirt
- Impurities from the environment

The correct filtering method is specified during system planning or determined by the necessary cleanliness class. Depending on requirements, pressure or return line filtering as well as additional bypass flow filtration is used. Only a return line filter with $\beta_{25} \geq 75$ (25 μm filter) is used for noncritical systems. Thus contamination of the tank is prevented, and the pump only sucks in clean oil. Pressure filters are used for systems with higher demands, e.g. smallest oil flows ($Q > 200 \text{ cm}^3/\text{min}$) or high, constant pressure on pressure valves.

Pressure filters are to be installed whenever proportional valves are used. Typically, filters with fineness of $\beta_{10} \geq 75$ (10 μm) or $\beta_3 \geq 75$ (3 μm) are used. Filters can only fulfil their function when built-in filter cartridges are cleaned or replaced in time, especially in the initial operating period. During operation, the level of pollution is checked by mechanical or electrical level. For further information, see 'Oil change'.

Servicing and maintenance

Service work may only be carried out by specialists. This requires knowledge of the machine's functions regarding switching on and off, as well as measures of safety engineering.

Work on systems that include accumulators may only be carried out after the fluid pressure is unloaded.

Regular inspection

The hydraulic system is subject to a simple inspection at short, regular intervals. An automatic monitoring system is already partly provided. Particularly the following is inspected:

- Oil level in the tank
- Working temperature is not to exceed 60°C
- Condition of the fluid (visual inspection, colour and smell of the hydraulic oil)
- Working pressures
- Gas pre-load pressure on the accumulator
- Leaks on the pump, valves, and pipelines
- Filter elements, for cleanliness (see 'Filter')
- Hose must be checked according to conditions and age.
- All mechanical and electronic sensors must be checked on function.
- All parts of the entire system must be checked on damage.
- Cleanliness must be checked.
- All safety equipment and labelling must be checked

Oil change

The frequency of oil changes is dependent on:

- Kind of liquid (ageing)
- Filtering
- Operating and environmental conditions (operating temperature)

Prescribed change intervals

The required cleanliness class as per ISO 4406 or NAS 1638 is dependent on the use of hydraulic components. It requires conscientious planning for filtering and periodic fluid inspection in order to guarantee the desired service life of the pumps and devices. Under these conditions, an oil change can be considerably delayed, or, depending on the evaluation of laboratory tests, completely omitted.

We refer to the service of well known oil or filter suppliers concerning fluid laboratory tests.

It is mandatory to inspect the breather filters regularly.

Spare parts

Original spare parts are to be used for repairs. For questions about purchasing spare parts or for malfunctions, please contact our After Sales Service.

Warranty

Fault correction without charge is only possible within the framework of the arranged guarantee. The information given in these instructions are of a general nature and require other professional procedures. Assistance with installation, start-up, and maintenance by our personnel can be arranged according to our service conditions.

Additional regulations and guidelines

Particularly we recommend the following regulations and guidelines

- International standard ISO 4413
- German standard VDMA 24572

Checklist for the inspection of hydraulic systems in industrial machines

1. Excessive noise in the system

Cause	Reason	Remedy
1.1 Cavitation in the system	Suction filter is blocked.	Clean or recondition.
	Internal width of the suction line is too small. Or: Objects in the suction line.	Install pipes with larger internal width.
	Too many bends in the suction line.	Lay new pipes or use pipes with larger internal width.
	Local constrictions in the suction line, e.g. partially closed valve, spring is too strong in check valve, damaged pipe or kinked hose.	Make valves accessible or change pipes or hoses are to be repaired or replaced.
	Fluid is too cold.	Use electric heating to warm pressure fluid to the recommended temperature.
	Viscosity of fluid is too high.	Check fluid.
	Vapour forms.	Lower working temperature to the correct value: Refill fluid or replace with suitable fluid.
	Feed pump fails.	Repair feed pump or replace.
	Speed of pump is too high.	Check speed of the motor (see also specifications in the hydraulic plan).
	Completely sealed tank.	Install breather.
	Suction line is too small or too long.	Increase diameter of the suction line.
1.2 Foam or air in the fluid	Fluid level in the tank is too low.	Refill oil. For systems with strongly changing oil level: Only fill between the min. and max. oil level.
	Incorrect tank design.	Improve design.
	Return line ends in tank above the fluid level.	Lay return flow line lower than the fluid level.
	Incorrect fluid.	Replace with the correct fluid, if necessary, contact the system supplier.
	Shaft seal on pump allows air to penetrate.	Replace seal.
	Fitting in the suction line allows air to invade.	Tighten fitting or replace.
	Porous suction hose.	Recondition hose.
	Poor air bleeding.	Vent system.

1. Excessive noise in the system

Cause	Reason	Remedy
1.3 Mechanical vibrations	Faulty alignment or loose coupling	Aligning or tightening
	Vibrations in the pipelines	Tighten or improve mounting.
	Pump defective or damaged	Repair or replace.
	Unsuitable pump type	Replace with more suitable pump type.
	Drive defective or damaged	Repair or replace.
	Unsuitable drive type	Replace with more suitable drive type.
	Pressure valve is unstable (oscillates).	Set correctly or replace with more suitable valve.

2. No pressure or insufficient pressure

Cause	Reason	Remedy
2.1 Pump does not deliver correctly.	Penetration of air into the suction lines	See error 1.2
2.2 High pump temperature	Worn out or damaged pump	Repair or replace
	Too little fluid viscosity	See error 1.1
	Insufficient or incorrectly adjusted cooling	Improve cooling line or adjust correctly. Ensure flow of cooling water.
2.3 Pump speed is too low or drive performance too small.	Coupling or belts slip or motor is faulty.	Remove defect parts.
	Motor is too small.	Use the correct driving motor.
2.4 Loss due to leakage from the pressure side in the return line	Incorrect pressure setting	Correct setting.
	Safety valve does not close because of dirt or there are defective parts.	Clean, repair or replace damaged parts.
	Directional valve or another valve is open because dirt or some other defective part is present, or due to electrical failure.	Damaged device is to be determined, adjusted, cleaned, repaired, or replaced.
	Damage to the cylinder hole, piston rod, or seal.	Damaged parts are to be repaired, replaced.
	Failure of piston seal, because the seal material is not suitable for the fluid used.	Use seals made of the correct material.
2.5 Feed pump fails (only for piston pump with feed pump).	Damaged pump, faulty drive, unsuitable fluid viscosity	See error 1.3

13

3. Pressure pulsations or flow fluctuations

Cause	Reason	Remedy
3.1 Cavitation in the pump	See error 1.1	See error 1.1
3.2 Foam or air in the fluid	See error 1.2	See error 1.2
3.3 Mechanical vibrations	See error 1.3	See error 1.3
3.4 Unstable pressure relief or safety valves	See error 1.3	See error 1.3
	Damaged valve seat.	Repair or replace.
	Valve has insufficient or no damping.	Install a more suitable device or damping equipment.
3.5 Valves stick.	Contamination	Drain fluid, clean system and parts, fill with clean fluid.
	Defective or warped	Replace device, remove warping.
3.6 Unsteady pump delivery	Unsuitable pump type or pump design	Replace with more suitable pump after contacting the pump system manufacturer.
3.7 Air in the system, which causes an irregular or yielding motion.	System is incompletely vented.	see error 1.2
	Electrical system is defective e.g. valves switch constantly.	Find and remove faults.

4. Too little or no pressure flow

Cause	Reason	Remedy
4.1 Cavitation of the pump	See error 1.1	See error 1.1
4.2 Foam formation or air in the fluid	See error 1.2	See error 1.2
4.3 Defective pump	See error 1.2	See error 1.2
4.4 Pump speed is too low or drive performance too small.	See error 2.3	See error 2.3
4.5 Loss due to leakage from the pressure side to the return line	See error 2.4	See error 2.4
4.6 Pump runs in the wrong direction of rotation.	Motor rotation direction is incorrect.	Reverse the e-motor.

5. Liquid temperature is too high

Cause	Reason	Remedy
5.1 Overflow losses	Pressure setting on pump is too high or safety valve is set too low.	Correct setting.
	Oil flows out at accumulator safety block.	Close accumulator drain valve on accumulator safety block.
5.2 Loss due to leakage from the pressure side in the return line	Valves function poorly and seals are faulty.	See error 2.4
	Fluid has incorrect viscosity (viscosity is too low).	Remove fluid and fill up system with fluid that has viscosity recommended by the manufacturer.
5.3 Fluid is delivered under pressure via safety and pressure limiting circulation valve into the tank, although pressure fluid is not needed.	Design of switching for system is not correct.	Provide the correct control system, e.g. switching to depressurised.
	Faulty function of the air bleeding system as a result of dirt or faulty parts	Clean, or if necessary, repair.
	Safety pressure is set too low.	Correct setting.
5.4 Insufficient cooling	Failure of the cooling water supply	Check cooling water supply, temperature and function of shut-off valve.
	Failure of the ventilating fan	Check function of the oil-air-heat exchanger acc. to manufacturers instruction.
	Deposits in the cooling water line	Clean.
5.5 Insufficient carrying away of heat	System has insufficient cooling surface to carry off delivered heat.	Install cooling system and/or increase tank capacity and surface.
	An increase in machine performance without corresponding increase in the cooling capacity	Improve cooling system and/or tank capacity and surface.
5.6 Overheated pump	Wear in the pump.	Repair or replace.
	Working with fluid whose viscosity is too low	See error 5.2
	Insufficient flushing of the pump	Increase diameter of the drain line and provide a flushing of the pump housing.
5.7 Fluid circulates too quickly.	Fluid supply is insufficient.	Increase fluid capacity.
	Fluid level is too low in the system.	Fill up system to the recommended level.
5.8 Too much viscous friction.	Cross-section is too small in the pipelines and valves.	Install pipes and valves that have the correct size.

General

The hydraulic fluid is an important component of any operating hydraulic systems. The fluid covers several tasks

- Power transmission
- Wear protection resp. wear reduction
- Heat transfer.

The importance of the fluid may be seen in the following statement: "Statistical data indicate, that more than 80% of all failures of hydraulic components are causal related to an improper condition of the hydraulic fluid.

The selection and the maintenance and/or control of the fluid for a hydraulic system is of major importance. The main criteria for this selection are given in the following.

Power transmission

An important index for the power transmission behavior of a hydraulic fluid is the bulk module E_{oil} , measured in bar. It describes, how much the volume of a fluid content is reduced under pressure.

A „hard“ hydraulic fluid (high bulk module) transmits pressures very fast and leads to a stiff hydraulic system. This is appreciated in closed loop controlled systems. „Stiff“ systems are achieved by small pressurized volumes, hard surrounding walls (pipes instead of flexible hoses) and high viscose fluids. Beside that pressure increases the bulk module of mineral oil.

A „soft“ hydraulic system is more subject to instability, but it is in general quieter, because high frequent pressure ripple is damped better.

The air content of a fluid plays an important role. Mineral oil contains some 9% air in solution under atmospheric pressure. If caused by under pressure in a hydraulic circuit (pump inlet, high fluid velocity in orifices or by turbulences due to high return line speed into the reservoir), part of this air occurs as bubbles, the systems stiffness is drastically reduced, which can cause several problems. The viscosity of the hydraulic fluid has a high influence on the **dynamic power transmission**. A high viscosity, that means a „thick“ fluid, leads to a worse fluidity and that means:

- Higher pressure losses in pipes and components
- Reduction of hydraulic-mechanic efficiency,
- More pressure drop in suction line, filling losses, cavitation
- Sealing and lubrication gaps are not getting fully filled, loss of lubrication.

A too low viscosity leads to the following problems:

- Higher leakage across all sealing gaps in the pump and in valves
- Thinner lubrication film causes more direct metal-to-metal contact and more wear in glide and roller bearings.

For these reasons the selection of the right viscosity and the best viskositys-temperature index needs highest attention. Some of the selection criterias are:

- Function principle of hydraulic pumps and motors used in the system
- Nominal pressure, nominal temperature (and range)
- Environmental temperature (and range)
- Length of piping.

The following limits are to be considered:

- Optimum working viscosity regarding efficiency, economy and safety

$$v_{opt} = 20 - 40 \text{ mm}^2/\text{s}$$

- Working viscosity for full operability

$$v_{operation} = 16 - 100 \text{ mm}^2/\text{s}$$

- Viscosity limits for reduced operating conditions (speed of rotation, pressure, load cycle)

$$v_{limit} = 12 - 300 \text{ mm}^2/\text{s}$$

- Lowest viscosity limit, start of the damaging metal-to-metal contact, only for short time and max. 50% nominal pressure

$$v_{min} = 8 \text{ mm}^2/\text{s}$$

- Highest start up viscosity, suction limit of pumps, only for short time when suction line is short and straight

$$v_{Start} = 800 \text{ mm}^2/\text{s}$$

- The recommended temperature range (fluid temperature) for the operation of a hydraulic system is between 30°C and 70°C, -30°C as the lowest and +90°C as the highest limit never should be exceeded depending on a fluid capable of these temperatures.

Mineral oil is offered in different viscosity classes (VG, viscosity grade). The characteristic number describes the nominal viscosity in mm²/s at 40°C:

VG 22 arctic conditions, extremely long pipes;
 VG 32 wintery conditions;

VG 46 normal conditions, closed buildings;
 VG 68 tropical conditions.

Viscosity-temperature-diagram for mineral oil

13

The correlation between viscosity and temperature usually is described in the double logarithmic Ubbelohde diagram.

Wear protection resp. wear reduction

In hydraulic components there are many gliding contacts partly under high (side) loads. Beside the correct viscosity, which on one hand is responsible for the required supply of lubricating fluid to the gap, on the other hand assures a stable lubricating film, the wear reduction capability of the hydraulic fluid is of major importance.

The describing parameter, the „Schadenskraftstufe“ (load carrying capability), is determined in the FZG-normal test A/8.3/90 according to DIN 51 354 part 2 (gear transmission test rig, 12 defined load steps at 90°C start temperature and 8.3 m/s circumference speed).

Depending on the nominal working pressure the following „Schadenskraftstufe“ is recommended

nominal pressure [bar]	"Schadenskraftstufe"
80 – 125	≥ 5
125 – 200	5 – 6
200 – 250	7 – 9
250 – 320	≥ 10
> 320	≥ 12

Max pressure limit: 1.25 x nominal pressure

Mineral oils are offered according to DIN 51 524 in different fluid types

- HL-fluids according to DIN 51 524 part 2, normal working load conditions, „Schadenskraftstufe“ 6 – 10
- HLP-fluids according to DIN 51 524 part 3, higher working load conditions, „Schadenskraftstufe“ > 10

Modern HLP-fluids today usually come with a „Schadenskraftstufe“ >12. They are equipped with wear prohibiting additives, which ensure a high safety of operation even under severe working conditions.

Beside the wear reduction due to the elasto-hydrodynamic properties of the hydraulic fluid, which are expressed in the FZG value, the behavior of the fluid in a mixed friction situation is very important for the use of a fluid in heavy duty hydraulic applications. In hydraulic components mixed friction occurs permanently, because the velocity difference between two components in contact very often is below the minimum velocity for hydrodynamic lubrication.

During mixed friction, i. e.: at a direct metal-to-metal contact between two surfaces, the “lubricity” of a fluid is most important. The lubricity is measured according to DIN 51 347 and is expressed as a specific load in N/mm², at which wear does not yet occur. This value sometimes also is called the “Brugger-value”.

It is measured in a test device, which moves two cylindrical test elements under a defined load. On one of the test elements a wear mark is created. This wear mark grows during the first seconds of the test, but then stays for several minutes at a constant size. The size of this wear mark gives a reading for the specific “wear free” load for this particular fluid in N/mm².

For general applications

this value has to be at least

30 N/mm², measured in accordance to DIN 51 347-2.

For heavily loaded hydraulic equipment and fast cycling machines and/or high dynamic loads this value should not be below

50 N/mm², measured in accordance to DIN 51 347-2.

But a fluid can maintain its wear prohibiting capabilities only, when it is not contaminated with hard and aggressive particles. Therefore in the interest of a long functional life of all components the **filtration of the hydraulic fluid** need special attention.

The sealing and gliding gaps in hydraulic components typically are in the range of 3-10 µm. That means they are in the same size range as most of the particles found in a hydraulic fluid.

The smaller the number of particles in a hydraulic fluid, the lower the wear of the hydraulic components will be. And wear is by nearly 90% the root cause for failure of hydraulic pumps and motors.

To ensure a disruption free operation of a general hydraulic system, at least a fluid quality (cleanliness level) of 20/18/15 according to ISO 4406 is required. The characteristic values indicate, how many particles in the size range >2 µm (1. value), >5µm 2. value) and >15 µm (3. value) are present in one ml of a fluid. The value 20 stands for 5.000 – 10.000 particles per ml, the 18 stands for 1.300 - 2.500 particles per ml, and the 15 for 160 – 320 particles per ml.

That illustrates, that a hydraulic fluid of the cleanliness level 20/18/15 still a huge number of particles is distributed in the fluid content. That also indicates, that this fluid quality only for general and low pressure applications is good enough.

When the requirements in functional safety and operational life are higher or at high pressure applications Parker recommends a cleanliness level 18/16/13 acc. ISO 4406. The fluid then is allowed to contain 1.300 – 2.500 particles $>4\mu\text{m}$, 320 – 640 particles $>6\mu\text{m}$ and 40 – 80 particles $>14\mu\text{m}$ per ml.

To achieve a cleanliness level the hydraulic circuit must be equipped with a suitable filtration system. But it has to be considered that filters never perform an absolute cleaning of the fluid. A filter element with a β -value of e.g. $\beta_{10} \geq 75$ does not retain all particles larger than $10\mu\text{m}$. Still 1/75 of all particles larger than $10\mu\text{m}$ will pass the element.

This review shows

- A reservoir filling of 100 l contains billions of contamination particles
- Even a „10 μ -filter“ will let pass millions of particles $>10\mu\text{m}$

On top of that it needs to be considered:

- across a breather and through the piston rod seal and wiper of a hydraulic cylinder particles can enter a hydraulic system
- wear on pumps, motors and valves adds more particles to the fluid
- mineral oil delivered in barrels typically has a cleanliness level of 21/19/16 according to ISO 4406 or worse.

Therefore it is very important, to pay highest attention also to the systems filtration in respect of its layout, its supervision and its maintenance.

The load to the fluid in hydraulic systems leads to its **aging**. Therefore the fluid needs to be checked for its perfect condition. This check should be performed at least twice a year and include as a minimum requirement the determination of neutralization number, viscosity, colour index and cleanliness level.

The operational life of the fluid depends very much on the operating pressure, the operating temperature, the circulation number (delivery of all pumps divided by the reservoir content) and the type of the fluid. General statements to the average time of usage therefore are impossible.

Heat dissipation

The temperature has an important influence on the properties of the hydraulic fluid. Viscosity, lubricity, aging and other significant features depend direct or indirectly on the temperature. That indicates, that the thermal balance of a hydraulic system needs to be considered during the layout and design. On one hand the fluid is stressed by a high temperature, on the other hand the fluid is the medium to transport the heat away from resistors, orifices and other throttling devices and friction zones. Therefore during layout it has to be made sure, that nowhere in the system a local overheating by dissipated heat can occur. That could destroy seals, lead to a failure of components due to lack of lubricity or finally lead to a destruction of the fluid itself.

A final comment to **seals**. A good hydraulic system should not show, that it operates with a fluid. There should be no leakage at all. In general hydraulic components are leak free. More than 90% of all problems occur at interfaces

- Ports
- Flange interfaces of valves
- Connectors

The assembly of the system is the main cause for problems in this area.

Nevertheless the system “hydraulic fluid & elastometric seal” is extremely sensitive. Temperature, chemical incompatibility and mechanical damages are the most frequent causes for a failure of this system. Please contact Parker if you have any question to this topic.

Parker does not give an explicit recommendation for a certain fluid product, fluid brand or fluid manufacturer. The permanent research and development in the field of hydraulic fluids and seal materials makes it impossible to test all possible combinations for compatibility with our components. The recommendations made here and the discussion of possible restrictions, relevant standards and other useful literature should help to select the right fluid for a hydraulic system and to design the power unit in a way that it is able to fulfill all requirements.

Special Fluids

Special fluids for environment protection

All statements made above are in principle also valid for these fluids. Regarding the selection/definition of the required viscosity level, the cleanliness level and the lubrication and wear protection behavior all criteria discussed in the mineral oil section have to be applied accordingly.

The following special fluid features and conditions are to be considered:

Fluids based on natural ingredients

- Good lubrication, viscosity-temperature characteristics better than standard mineral oil.
- Density slightly higher than mineral oil, therefore check for good suction conditions!
- Pour point approx. – 30°, therefore not suitable for low temperature operation.
- Accelerated aging. First fluid change after 500 h, second change after another 1.000 h. Then all 2.000 h or annually, if less than 2.000 h annual operation.
- High affinity to water. The ingress of water has to be avoided under all conditions. At temperature above 50°C destroys the fluid if water is present.
- Can be mixed with mineral oil (under loss of biological degradability!)
- Internal coating of reservoirs etc. to be compatible with the fluid. Check with fluid supplier.

Fluids basing on esters (synthetical esters)

- The same remarks as for fluids based on natural ingredients

Fluids basing on polyglycol (not HFC/water glycol)

- Good lubrication, viscosity-temperature characteristic better than standard mineral oil.
- Aging/durability according to actual knowledge similar to mineral oil.
- Pourpoint approx. – 40°C, be careful at low temperatures!
- Density significantly higher than at mineral oil. Therefore the max. input speeds for self priming pumps are to be reduced by 20%.
- Use fluorcarbon as seal material. Our hydraulic components are tested with mineral oil; they need to be completely made empty before installation!
- Normal paints and coatings are destroyed. Please contact fluid supplier!
- Never mix with mineral oil, solid sediments will develop and block filters, orifices etc.!

Note !

Even bio-degradable fluids need to be disposed according to special disposing rules (like mineral oil). Prior to the use of these fluids we recommend to contact our specialists.

Fluids according to DIN 51 502 (HF-Fluids)

These fluids are fire resistant. The following classes are used:

HFA	oil in water emulsion:	95 – 98% water
HFB	water in oil emulsion:	>40% water
HFC	water containing solutions: (poly-glycole)	35 – 55% water
HFD	water free fluids (mainly phosphor acid ester).	

The operation of Parker hydraulic components with HFD fluids within the limits of the fluid suppliers specification (temperature range, filtration, seal material compatibility) and the viscosity limits of our components is possible without restrictions.

The operation with HFC involves certain restrictions regarding pressure limitation and bearing life reduction in rotating units. Please contact our specialists. Parker does not give a general release for the operation with HFA and HFB fluids. In certain cases a special approval can be given upon request.

If you are not sure, wether our products can be used with a special fluid or not, please call us. Our specialists are glad to answer your questions and to give you any necessary support.

Parker's Motion & Control Technologies

At Parker, we're guided by a relentless drive to help our customers become more productive and achieve higher levels of profitability by engineering the best systems for their requirements. It means looking at customer applications from many angles to find new ways to create value. Whatever the motion or control technology need, Parker has the experience, breadth of product and global reach to consistently deliver. No company knows more about motion and control technology than Parker. For further information call 00800 27 27 5374

AEROSPACE

Key Markets

- Aircraft engines
- Business & general aviation
- Commercial transports
- Land-based weapons systems
- Military aircraft
- Missiles & launch vehicles
- Regional transports
- Unmanned aerial vehicles

Key Products

- Flight control systems & components
- Fluid conveyance systems
- Fluid metering delivery & atomization devices
